THOUGHT FOR THE WEEK:

'Jesus said: Believe me, woman, the hour is coming when you will worship the Father neither on this mountain nor in Jerusalem... But the hour will come – in fact it is here already – when true worshippers will worship the Father in spirit and truth: that is the kind of worshipper the Father wants. God is spirit, and those who worship must worship in spirit and truth.'

– *Gospel of John 4:21-24*

"Social Credit is the Policy of a Philosophy". What does this mean? It simply means that every action we take towards a certain policy is the result of a philosophy. There are two basic philosophies in the world, and, because these philosophies are diametrically opposed to each other, they give rise to conflicting policies.

The first philosophy is one which conceives of all power and authority arising from a point *external* to the individual. The second philosophy conceives of all power and authority arising from *within* the Individual.

The first philosophy automatically gives rise to policies which necessitate a certain type of organisation in order to *impose* certain conditions upon the Individual. This philosophy results in the Individual being subordinated to the State, the System, or some other abstraction. The second philosophy, which conceives of reality as an environment in which the Individual can make the greatest progress towards self-development, gives rise to a social structure in which there is the greatest possible, decentralisation of all policies, including financial policies. Jesus of Nazareth stated the *Christian – the realistic philosophy*, when he said: The Kingdom of God is within you."

– Eric D. Butler in *Social Credit Training Course*, Lecture 1

FREE ENERGY? FREE.... ENERGY... ?? A social creditor came across the following article regarding the development of what is essentially free energy technology:

http://ca.tech.yahoo.com/blogs/the_working_guy/rss/article/3638.

He wrote that it would appear Nickola Tesla was right. Of course, he also points out, the same article goes out of its way to assert that such technology will never be able to run your house or your office. That is simply not true.... But first the article:-

In this issue: • *Thought For The Week* • *Free Energy? Free...Energy...??* • *And...Now...What About Water Electric Energy?* • *Or This? Electric Cars ...* • *Greg Sheridan Back On The Anti-Racism Bandwagon* • *Guess Who's Coming To Dinner Now?*

"Prototype Nokia phone recharges without wires," by Christopher Null. "Pardon the *cliche*, but it's one of the holiest of Holy Grails of technology: Wireless power. And while early lab experiments have been able to "beam" electricity a few feet to power a light bulb, the day when our laptops and cell phones can charge without having to plug them in to a wall socket still seems decades in the future. Nokia, however, has taken another baby step in that direction with the invention of a cell phone that recharges itself using a unique system: It harvests ambient radio waves from the air, and turns that energy into usable power. Enough, at least, to keep a cell phone from running out of juice.

While "traditional" (if there is such a thing) wireless power systems are specifically designed with a transmitter and receiver in mind, Nokia's system isn't finicky about where it gets its wireless waves. TV, radio, other mobile phone systems – all of this stuff just bounces around the air and most of it is wasted, absorbed into the environment or scattered into the ether. Nokia picks up all the bits and pieces of these waves and uses the collected electromagnetic energy to create electrical current, then uses that to recharge the phone's battery. A huge range of frequencies can be utilized by the system (there's no other way, really, as the energy in any given wave is infinitesimal). It's the same idea that Tesla was exploring 100 years ago, just on a tiny scale.

Mind you, harvesting ambient electromagnetic energy is never going to offer enough electricity to power your whole house or office, but it just might be enough to keep a cell phone alive and kicking. Currently Nokia is able to harvest all of 5 milliwatts from the air; the goal is to increase that to 20 milliwatts in the short term and 50 milliwatts down the line. That wouldn't be enough to keep the phone alive during an active call, but would be enough to slowly recharge the cell phone battery while it's in standby mode, theoretically offering infinite power – provided you're not stuck deep underground where radio waves can't penetrate. Nokia says it hopes to commercialize the technology in three to five years."

Meanwhile, Wallace Klinck of Canada has responded to the above article: "Yes, the 'powers that be' want us to now believe that energy is 'scarce', thus creating an artificial scarcity complex. As we all know, energy can neither be created nor destroyed.

Interesting! Just goes to further demonstrate that we do not know the future and cannot possibly predict what it may hold.

The universe consists of energy and matter. Our challenge as humans is merely to discover means of converting one to the other in forms useful to us. If we imagine that the energy and matter of the universe is not infinitely greater than man's relatively infinitesimal needs, then surely something is wrong with our thinking. We do, of course, need to be sufficiently innovative to accomplish this task. But so far the success rate has been continuous and growing at a stupendous exponential rate despite all the enormous sabotage characteristic of the system under orthodox financial policy.

"Today, I was listening to the "Money Talks" radio call-in program from Vancouver (Canada) and what a marvelous opportunity it provided to expose the whole financial scam. Even the guests were pointing out that few people realized that money is created out of nothing.

They were speculating and seemingly even agonizing over what options are open to governments to deal with an admitted problem of excessive and unsustainable debt. They could see no way except by inflating through more debt and obviously they equate credit with monetary debt - not thinking in terms of real and financial credit, etc.

Where are the hundreds of thousands of informed Social Creditors who could have phoned in to make absolute nonsense of the whole set of misconceptions?

Social Credit exists incarnate in the here and now and we have to realize and maximize it not sometime or somewhere, but here and now, each day, as we live. If the various political parties are not

interested in Social Credit policies then it is up to an informed, outraged and militant society to put the fear of God (and loss of office with it perks, "status" and privileges) into these people.

It is this fear ultimately to which the politicians will respond and they will only do so when they realize that the biggest threat to their sinecure comes from an informed and sustained multi-level consumer-citizen revolt. At that point they may even fall all over each other in advocating the appropriate reforms.

I think it is a great personal and societal tragedy for Social Crediters to await some future speculative success at the political polls in the hope of achieving their goals.

Social Credit is a general social concern rather than a political party issue. We need to unify consumers in making effective demands for Social Credit policies.

Political parties tend to divide the electorate and thereby dissipate constructive energy which might otherwise be effectively mobilized toward the realisation of a genuine Social Credit dispensation."

Further reading: "Prodigal Genius" : The Life of Nickola Tesla" by John O'Neill. Tesla was an inventor, born in 1856. He was more than a producer of new devices, he was a discoverer of new principles, although he found it difficult to convince a number of scientists; especially his ideas on Alternating current. He dealt with and improved many aspects of electrical equipment, high frequency and high-powered current far in advance of the time. He invented radio telegraph, **he could and did produce lightning and could transmit electrical power without wires.**

He was a workaholic and his work generally took first place over love, family, money and people. Because of this he was exploited by many, a number of his inventions were claimed to have been the work of others, i.e. Edison. He was financed on different occasions by J.P. Morgan, Westinghouse and in fact anyone who he could convince with his experiments. All the money he did make, and this was quite substantial, went into more equipment and more building to carry out more experiments. He was aware that some of his inventions could be used for the wrong purposes but had no intention that they should be.

He was a man before his time ... the book does not bog you down with technical details (there are other books which do that), it is a really good read for people with very little electrical knowledge. In his final years he struggled with his health, and financially. He moved from hotel to hotel and the final chapter in the book describe his love of pigeons and concludes with a moving spiritual experience. **You will have to read the book – orders taken, \$35.00 plus postage.**

AND... NOW... WHAT ABOUT WATER ELECTRIC ENERGY? The following report came from the *ISIS Report*, 25/06/09. Water Electric: "Water charges up with electricity when exposed to sunlight, offering the potential for an inexhaustible supply of squeaking clean energy and challenging conventional understanding of bioenergetics" writes Dr. Mae-Wan Ho.

"Put some water next to any hydrophilic (water-loving) surface and expose it to sunlight, or even light from an ordinary light bulb, and the water will charge up with electricity all by itself. This is the latest in a series of extraordinary discoveries about water from the laboratory of U.S. bioengineer Gerald Pollack at the University of Washington in Seattle..."

Full article can be found on the I-SIS website at: <http://www.i-sis.org.uk/WaterElectric.php>

OR THIS? ELECTRIC CARS.... "Another spectacular potential addition to the real credit of society?" asks Wallace Klinck of Canada. The message on the website reads:

Paradigm smasher: This guy is going to ruin everything for the global warming/carbon tax crowd. Non-polluting cars that are high performance and fun? Tell me it ain't so Big Al (Gore). How are we

supposed to wallow in "inconvenient truths" if trouble-makers like this mess things up by smoking the car companies with superior home brew engineering?

Remember, the personal computer was the creation of a bunch of unfunded individuals, not the military-industrial complex.

It's pretty clear that the oil companies that control Detroit don't want us to have them. Even if it means bankrupting the car manufacturers and giving the market to the Chinese. But there's a silver lining... We're not far from being able to make our own. Then what? Criminalize battery possession? Details: <http://www.brasschecktv.com/page/650.html> - Brasscheck.

P.S. Please share Brasscheck TV e-mails and videos with friends and colleagues. That's how we grow. Thanks. Brasscheck TV, 2380 California St., San Francisco, CA 94115.

GREG SHERIDAN BACK ON THE ANTI-RACISM BAND WAGON by James Reed: It is good to get things back to normal, neat and organised. I had found myself agreeing with so many recent articles by *The Australian's* foreign editor Greg Sheridan, that I was starting to get worried. Was it Greg...or was it me? Then he writes 'Blind Eye to Racism' (*The Australian*, 4/6/09, p.14) saying that the bashing of Indian students "is an appalling episode in this nation's history". Come now, more Indian students get bashed in India by Indians in a few hours than has happened in Australia. In India entire ethnic minorities are oppressed. This is blowing a relatively minor incident into one which, the elites hope, will have international significance.

The pattern of lamenting about "how racist we are" continues in the media (eg., *The Australian*, 6-7/6/09, p.24). But if we were really racists, would we have allowed this multiculturalism mess to have even happened in the first place? Contrary to Sheridan, within a couple of weeks, the media will move onto something else and "curry bashings" will be forgotten. The media will find something else to whinge about.

GUESS WHO'S COMING TO DINNER NOW? by James Reed: The same pattern with boring monotony: a crisis occurs somewhere in the world, people want to flee and if they are non-white they are welcomed to Australia and the West with open arms. Hundreds of thousands, if not millions, come from chain migration. Sri Lanka is said to face a "refugee catastrophe" (*The Australian*, 21/5/09, p.9) and the pattern may be continued.

About 300,000 displaced people are in a refugee comp in the northern city of Vavuniya. U.N. types want access because they want to do what they do best, as seen in Africa's Darfur camps – move as many people as possible to the West. However the Sri Lankan government has restricted access to the camp. Further, in a turnabout that has shocked the on world set, the Sri Lankan government has warned Western governments not to accept Tamil refugees.

This is good news as Australia could be swamped by Tamil refugees. Canberra though wants more refugees to help with its Asianisation programme. Australia has no moral duty to help these people.

An editorial in *The Australian* (22/5/09, p.13) said, "Sri Lanka became independent in 1948 with the hope that it would become a multi-ethnic, multilingual, multi-religious state, free of the religious dissention that bedevilled the independence of India and Pakistan. The Sri Lankan diaspora is tragic testimony to the failure of those high minded ideals, as is the brawling between Tamils and Sinhalese in Sydney at the weekend."

Make Australia more multicultural and expect more of the same. At some point ethnic conflict will affect the smooth operation of Australian capitalism. What a dilemma our power elites face!
