- the need to give the widest possible protection and assistance to the family as the natural and fundamental group unit of society, particularly while it is responsible for the care and education of dependent children;
- the need to protect the rights of children and to promote their welfare;
- the means available for assisting parties to a marriage to consider reconciliation or the improvement of their relationship to each other and to the children of the marriage.

In relation to the guardianship and custody of children, the Family Law Act provides that both parties to a marriage have, subject to a court order to the contrary, the joint guardianship and custody of any children of the marriage. However, one parent can ask the Court for sole custody of a child even if no divorce has been sought.

In disputes over custody, a child may be separately represented. The paramount consideration for the Court in the determination of all such disputes is the welfare of the child. However, where a child has reached 14 years of age the Court may not make an order contrary to his or her wishes unless there are special circumstances. In relation to the welfare of children a divorce decree usually will not become effective unless the Court is satisfied that proper arrangements have been made by the parties for the welfare of their children.

Under the Family Law Act, the right of one party of a marriage to receive maintenance from the other is based on the needs of the party seeking it and the ability of the other party to pay. An application for maintenance may be made by either husband or wife, and irrespective of whether the parties intend to divorce.

There are specific matters for the Court to consider when it is dealing with maintenance applications. These include:

- the age and state of health of the parties;
- the income, property and financial resources of each of the parties and their financial obligations;
- whether either party is entitled to a pension or superannuation;
- the length of the marriage and what is an appropriate standard of living for each party;
- whether either party has to care for children;
- the extent to which the marriage has affected the earning capacity of the applicant;
- the possibility of the applicant taking on a training course or further educational course to improve his or her employment prospects.

The Act also provides for the registration and court approval of maintenance agreements made by the parties.

Both parties are liable to maintain their children according to their respective means and the Court is guided by similar considerations in deciding what order to make.

The Court has power to settle disputes about the family assets, including the power to order a transfer of legal interests in property. When dealing with these disputes, the Court considers the interest each party has in the property, the financial and non-financial contributions made by each party during the marriage, and the matters the Court is required to consider in dealing with maintenance applications.

## **Family Court of Australia**

The judges of the Family Court are chosen because of their suitability to deal with matters of family law by reason of their training, experience and personality. They do not wear wigs and gowns. Staff attached to the Court include trained counsellors and legally qualified Registrars and Deputy Registrars.

Proceedings under the Act in the Family Court are heard in private. No publicity about any proceedings under the Act is permitted, unless otherwise directed by the Court. The publication of law court lists and law reports, or other publications of a technical character directed to the legal or medical professions, is exempted from this prohibition.

The Family Court aims to be a 'helping' court. A Principal Director of Court Counselling and a staff of court counsellors are attached to the Court to help parties to a marriage settle their problems. This help is available to parties who are not even contemplating divorce or other proceedings, but who may need counselling assistance. These services complement those already provided by voluntary marriage counselling agencies. People may approach the Court counselling service directly—in person, in writing, by telephone or through a legal practitioner.

## State and Territory courts

Australian State and Territory courts have original jurisdiction in all matters brought under State or Territory statute laws, and in matters arising under Federal laws, where such matters have not been specifically reserved to courts of Federal jurisdiction. Most criminal matters, whether arising under Federal, State or Territory law, are dealt with by State and Territory courts.

Each State and Territory court system is organised and operates independently. However, within each system, which comprises both courts of general jurisdiction and specialist courts and tribunals, the courts are organised hierarchically according to the nature of the matters with which they may deal.

### Appeals

County and District Courts and State and Territory Supreme Courts have jurisdiction to hear appeals against the decisions of lower courts and some specialist tribunals.

The procedures concerning the right of appeal are laid down by statute in each State and Territory, and appeals may be lodged against matters such as the correctness of the verdict or the severity of the sentence imposed. However, appeals against Supreme Court decisions are heard in most States by a Full Bench of the Supreme Court which usually comprises three judges of the Supreme Court. Appeals from State Supreme Court decisions may be taken to the Federal Court of Australia or the High Court of Australia depending on the nature of the matter involved. Appeals from decisions of Territory Supreme Courts are taken to the Federal Court of Australia or to the High Court if special leave is given by the High Court.

### Special courts and tribunals

Each Australian State and Territory administers particular areas of the law through specialist courts or tribunals, such as Small Claims Courts, Licensing Courts, etc. These courts or tribunals deal primarily with civil matters or matters of an administrative nature.

### Courts of Marine Inquiry

Matters which come within the jurisdiction of Courts of Marine Inquiry are contained in the *Navigation Act 1912*. The principal areas of jurisdiction are to make inquiries into casualties, all missing ships, or entailing loss of life on or from ships and charges of incompetency or misconduct.

When the Department of Transport and Communications is advised of an incident which may warrant the convening of a Court of Marine Inquiry, the Minister will appoint an officer to conduct a Preliminary Investigation. The officer will conduct interviews with the parties involved and, based on the results of these interviews, advise the Minister as to whether or not the circumstances warrant a request by the Minister for a Court of Marine Inquiry to be convened. The Governor-General, by proclamation, establishes the Court of Marine Inquiry. Findings of the Court are forwarded to the Minister.

### Statistics

Information relating to the operation of courts in particular Australian States may be obtained from the respective State *Year Books*.

## Administrative bodies

### Administrative Appeals Tribunal

The Administrative Appeals Tribunal was established by the *Administrative Appeals Tribunal Act 1975* and came into operation on 1 July 1976. Its President is a judge of the Federal Court of Australia. It is an independent tribunal whose function is to review decisions made by Commonwealth Ministers, authorities and officials under certain laws of the Commonwealth. The Tribunal is able to substitute its own decision in those areas in which

it has jurisdiction. The Tribunal has jurisdiction under more than 200 enactments including decisions under the *Social Services Act 1947*, *Compensation (Commonwealth Government Employees) Act 1971*, *Migration Act 1958*, *Customs Act 1901*, *Export Market Development Act 1974*, the Air Navigation Regulations, the *Freedom of Information Act 1982* and the *Repatriation Act 1920*. Further additions to the Tribunal's jurisdiction are made from time to time.

The Principal Registry is in Canberra and there are Tribunal Registries in each capital city.

The Administrative Review Council was also established by the *Administrative Appeals Tribunal Act 1975*. The principal functions of the Administrative Review Council are to make recommendations to the Attorney-General on rights of review of administrative decisions and on the procedures of administrative tribunals.

### **Administrative Decisions (Judicial Review) Act**

The *Administrative Decisions (Judicial Review) Act 1977*, which came into operation on 1 October 1980, provides for judicial review in the Federal Court of Australia of administrative action taken under Commonwealth legislation. The Court is empowered where an order of review is sought by an aggrieved person to review the lawfulness of a decision, conduct leading up to the making of a decision or circumstances where there has been failure to make a decision. The grounds on which review may be sought and the powers of the Court are set out in the Act. In many cases, a person who is entitled to seek judicial review in respect of an administrative decision may seek a statement of reasons for the decision from the decision-maker.

### **Commonwealth Ombudsman**

The office of the Commonwealth Ombudsman was established by the *Ombudsman Act 1976* and commenced operation in June 1977. Additional responsibilities have been given to the office through the *Complaints (Australian Federal Police) Act 1981*, the *Freedom of Information Amendment Act 1983* and the *Ombudsman Amendment Act 1983*. The Ombudsman is empowered to investigate complaints about the administrative actions of Commonwealth Government departments and prescribed authorities, and complaints about the conduct of members of the Australian Federal Police, and its practices and procedures. Under the *Ombudsman Amendment Act 1983* the Ombudsman is empowered to investigate complaints from members or former members of the Australian Defence Force relating to service in the Defence Force or as a consequence of a person serving or having served in the Defence Force.

The Ombudsman is also empowered to investigate complaints about the actions of agencies in dealing with requests made under the *Freedom of Information Act 1982* and may represent a complainant before the Administrative Appeals Tribunal to seek review of a refusal to give access.

Where the Ombudsman is of the opinion that, after completing an investigation into a complaint, remedial action is required, he reports to the department or authority concerned and may include any recommendations he thinks fit to make. If the department or authority fails to comply with a recommendation contained in his report, the Commonwealth Ombudsman may report to the Prime Minister and to the Federal Parliament. The Central Office of the Commonwealth Ombudsman is located in Canberra and there are regional offices in Sydney, Melbourne, Brisbane, Perth and Adelaide. In Tasmania, the Commonwealth Ombudsman is represented by the Tasmanian Ombudsman and the Northern Territory Ombudsman represents the Northern Territory.

### **The Human Rights Commission**

The Human Rights Commission was set up by the Commonwealth Government in December 1981 to *promote* and *protect* human rights in Australia. The human rights with which it is concerned are those set out in six United Nations instruments:

- The International Covenant on Civil and Political Rights;
- The Declaration of the Rights of the Child;
- The Declaration on the Rights of Mentally Retarded Persons;
- The Declaration on the Rights of Disabled Persons;
- The International Convention on the Elimination of All Forms of Racial Discrimination;
- The Convention on the Elimination of All Forms of Discrimination Against Women.

The Commission works under three Acts—the *Human Rights Commission Act 1981*, the *Racial Discrimination Act 1975*, and the *Sex Discrimination Act 1984*.

Under the Human Rights Commission Act, the functions of the Commission are fourfold:

- (i) to review legislation for its consistency with human rights;
- (ii) to inquire into, and where practicable effect a settlement of, issues including complaints that have come to its notice;
- (iii) to promote understanding, acceptance and public discussion of human rights;
- (iv) to undertake and co-ordinate research and educational programs affecting human rights.

Where the Commission considers a change in Commonwealth law or practice is required, it is to report this to the Attorney-General, and its reports must be made public by tabling in Parliament.

Under the Racial Discrimination Act, the Commission is charged with functions in relation to racial discrimination similar to those numbered (ii) to (iv) above in relation to human rights generally.

Under the Sex Discrimination Act, the Commission is charged with functions in relation to sex discrimination similar to those numbered (i) to (iv) above.

Investigation and resolution of complaints made under the Racial Discrimination Act are carried out by the Commissioner for Community Relations on behalf of the Commission.

Complaints made under the Sex Discrimination Act are investigated by the Sex Discrimination Commissioner who endeavours, by conciliation, to reach a settlement of the matter. Complaints which cannot be settled by conciliation can be referred to the Human Rights Commission.

The Racial Discrimination Act applies regardless of whether the discrimination falls within Commonwealth, State or Northern Territory jurisdiction. The human rights function is related to Commonwealth laws and practices under those laws, although the Human Rights Commission Act provides for co-operation with State agencies in the promotion of human rights. The Sex Discrimination Act applies throughout Australia, however, it may not apply to every act of discrimination because of some limitations on Commonwealth powers. In States that have anti-discrimination legislation, people making complaints have a choice of bringing their complaints under either the State Act or the Commonwealth Act; but a complaint can not be made under both Acts.

## Freedom of Information Act

The *Freedom of Information Act 1982*, which came into operation on 1 December 1982, has two objectives:

- to make available to the public information about the rules, practices and operations of Commonwealth Government departments and authorities;
- to create a general right of access to documents in the possession of Ministers and agencies.

In order to achieve these objectives the Act defines the rights of members of the public to obtain access to documents, and sets out a range of obligations and restrictions on departments and the public for exercising these rights.

The right of access does not extend to all documents. Exempt are:

- certain documents to which the *Archives Act 1983* applies;
- documents affecting national security, defence, international relations and relations with States;
- Cabinet and Executive Council documents;
- internal working documents (subject to certain limitations on what may be exempt);
- documents affecting enforcement of the law and protection of public safety;
- other documents exempt by reason of secrecy provisions of other enactments, financial or property interests of the Commonwealth, personal privacy, legal professional privilege, etc.;
- documents made available for purchase or open access upon payment of a fee;
- documents created before 1 December 1977.

However, there are two exemptions to this last restriction on access:

- a person has a right of access to documents created before 1 December 1977, necessary to the understanding of a document already legally in that person's possession;
- individuals have the right of access to documents which pre-date the commencement of the Act by up to five years, providing that the documents relate to the individual.

The public is not required to provide reasons for requesting access to documents. However, all requests under the Act should be in writing and provide such information concerning the document as is reasonably necessary to enable a responsible officer to identify the document. Where a person wishes to make a request, or has made a request that does not comply with the provisions of the Act relating to requests for access, it is the duty of the agency to take reasonable steps to assist the person to make the request in a manner that complies with the Act.

Provisions exist whereby a person may apply to have an amendment made to information relating to that person's own personal affairs

The Act contains extensive provisions for review of decisions made under the Act, including review by the Administrative Appeals Tribunal and the Commonwealth Ombudsman.

### Royal Commissions—Commonwealth

Australian Governments have from time to time established Royal Commissions to inquire into, and report on, matters of public concern.

A Royal Commission is established by the Governor-General, on the advice of the government, issuing a commission to a person or persons to inquire into and report on specified matters. At the end of its inquiry, a Royal Commission presents its report to the Governor-General for consideration by the government.

The power to issue Letters Patent to inquire is a prerogative of the Crown. The *Royal Commissions Act 1902* confers powers on a Royal Commission to compel the attendance of persons, the giving of evidence, and the production of papers. It also creates a number of offences (e.g. failure to attend a Royal Commission when summoned, or failure to produce papers) and gives some protection to Commissioners and witnesses against legal liability. The constitutional foundation of the Royal Commissions Act is section 51 (xxxix) of the Constitution, which provides that the Commonwealth Parliament may make laws with respect to 'matters incidental to the execution of any power vested by this Constitution in the Parliament or in either House thereof, or in the Government of the Commonwealth, or in the Federal Judicature, or in any department or officer of the Commonwealth'.

#### LETTERS PATENT ISSUED FROM 1.7.82 TO 30.6.86

| <i>Name of Royal Commission</i>                                                               | <i>Commissioner(s)</i>                                         | <i>Date of issue of Letters Patent</i> |
|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------|----------------------------------------|
| Royal Commission on the Use and Effects of Chemical Agents on Australian Personnel in Vietnam | THE HON. MR JUSTICE P. G. EVATT, D.S.C.                        | 13 May 1983                            |
| Royal Commission on Australia's Security and Intelligence Agencies                            | THE HON. MR JUSTICE R. M. HOPE, C.M.G.                         | 17 May 1983                            |
| Commission of Inquiry into Compensation Arising from Social Security Conspiracy Prosecutions  | THE HON. DAME ROMA MITCHELL, D.B.E.                            | 9 February 1984                        |
| Royal Commission into British Nuclear Tests in Australia Between 1952 and 1963                | THE HON. J. R. MCCLELLAND<br>MRS J. FITCH<br>DR W. J. A. JONAS | 16 July 1984                           |

#### FINAL ROYAL COMMISSION REPORTS PRESENTED FROM 1.7.84 TO 30.6.86

| <i>Name of Royal Commission</i>                                                               | <i>Date of presentation</i> | <i>Tabled in Parliament</i> |
|-----------------------------------------------------------------------------------------------|-----------------------------|-----------------------------|
| Royal Commission on the Activities of the Federated Ship Painters and Dockers' Union          | 26 October 1984             | 22 February 1985            |
| Royal Commission on Australia's Security and Intelligence Agencies                            | 20 December 1984            | 22 May 1985                 |
| Royal Commission of Inquiry into the Activities of the Nugan Hand Group                       | 4 July 1985                 | 27 November 1985            |
| Royal Commission on the Use and Effects of Chemical Agents on Australian Personnel in Vietnam | 31 July 1985                | 22 August 1985              |
| Royal Commission into British Nuclear Tests in Australia between 1952 and 1963                | 20 November 1985            | 5 December 1985             |
| Royal Commission of Inquiry into Alleged Telephone Interceptions                              | 30 April 1986               | 1 May 1986                  |
| Commission of Inquiry into Compensation Arising from Social Security Conspiracy Prosecutions  | 30 April 1986               | 10 June 1986                |

## Consumer affairs

The Commonwealth involvement in consumer affairs derives substantially from the *Trade Practices Act 1974*. The Attorney-General has responsibility for Part V (Consumer Protection) of the Act which deals with unfair practices, provides private law rights against sellers, manufacturers and importers, and provides for product safety (including provision for the banning and/or recall of goods considered to be unsafe) and information standards.

The function of the Office of Consumer Affairs located in the Attorney-General's Department is to advise the Minister on matters such as the operation of Part V and related provisions of the Act (including advice on proposed private prosecutions), the banning and/or recall of unsafe goods under the Act, the development of product safety and information standards under the Act, the development of voluntary product recall codes, uniform legislation proposals, the development of consumer education programs, the operation of a national consumer complaints statistics system, and on other developments in the economy affecting consumers. The National Consumers Affairs Advisory Council provides independent advice to the Minister on consumer affairs issues. The members of this Council have backgrounds in consumer affairs, industries, trade unions and government.

The Trade Practices Commission is generally responsible for the administration and enforcement of the Trade Practices Act, except for the role of the Office of Consumer Affairs as indicated above. It receives complaints from consumers but is primarily concerned with issues of national significance. The activities of the Trade Practices Commission are distinct from those of State and Territory consumer affairs agencies which administer their own legislation and provide the principal consumer complaint handling mechanisms.

Co-ordination of consumer affairs activities is undertaken by the Standing Committee of Consumer Affairs Ministers and through meetings of Officers of Consumer Affairs. There is also a Commonwealth/State Consumer Products Advisory Committee to provide a co-ordinated approach to product safety and information matters.

In addition to this, the Australian Federation of Consumer Organisations (AFCO) receives an annual grant under the Commonwealth's Grant-in-Aid Scheme. AFCO comprises a membership of 60 consumer and community groups and was set up with Commonwealth sponsorships to represent the consumer view to all levels of government and industry.

## Legal aid

The purpose of providing legal aid is to ensure that no person involved in a legal dispute or action should be without legal assistance by reason of not being able to pay for it, and is based on the notion of justice and equity before the law.

Legal aid in Australia is delivered through a variety of schemes operated at Federal, State and local levels. The principal schemes are those of the Australian Legal Aid Office, the legal aid commissions (which operate in five States and the Australian Capital Territory) and the Aboriginal legal services. In addition there are numerous community based legal aid agencies and certain law society schemes.

Historically, legal aid schemes in Australia were initiated by State governments with Public Solicitor or Public Defender schemes in Queensland, Victoria and New South Wales. The Law Society in South Australia began a legal assistance scheme in 1933, and law society schemes followed in other States. In 1973, the Australian Legal Aid Office was established to provide legal assistance in the Commonwealth area.

It is now the policy of the Commonwealth Government that legal aid other than that given by Aboriginal legal services and voluntary and community agencies be provided in each State and Territory through a single independent statutory commission, established by State or Territory legislation. Under this policy, legal aid is provided by both salaried and private lawyers and funded by the Commonwealth in Federal matters. The States continue to fund legal assistance provided in relation to State matters. Pursuant to agreements entered into between the Commonwealth and the States, independent statutory commissions providing legal advice and assistance in both Commonwealth and State matters have been established in Queensland, South Australia, Victoria, Western Australia and the Australian Capital Territory. A statutory commission has also been established in New South Wales, but its

functions do not extend to Commonwealth matters. Legal aid commissions have not yet been established in Tasmania and the Northern Territory, and in these places, as well as New South Wales, the Australian Legal Aid Office continues to provide legal advice and assistance in Commonwealth matters.

Aboriginal legal services operate in all States and Territories and are funded by the Department of Aboriginal Affairs. Community law centres which also operate in all States and the A.C.T. are funded by Commonwealth, State, and in some instances, local government.

The Commonwealth Attorney-General administers a growing area of legal assistance in special Federal areas outside the scheme of independent statutory commissions. This assistance is provided under various Commonwealth Acts (such as the *Conciliation and Arbitration Act 1904*, *Administrative Appeals Tribunal Act 1975* and the *Trade Practices Act 1974*) and administrative schemes (e.g. aid for Public Interest and Test Cases and for cases involving the recovery of children removed overseas).

Selected details of the income and expenditure of major Australian Legal Aid schemes and further information on the operation of these schemes are available from Annual Reports of the former Commonwealth Legal Aid Council and the Commonwealth Attorney-General's Department.

## The police

The primary duties of the police are the prevention and detection of crime, the protection of life and property, and the enforcement of law to maintain peace and good order. In addition, they may perform a variety of other duties in the service of the State, including the regulation of street traffic, acting as clerks of petty sessions, crown land bailiffs, foresters, mining wardens and inspectors under the Fisheries and various other Acts. With the exception of the Australian Federal Police, police forces in Australia are under the control of the State and Northern Territory Governments, but their members perform certain functions for the Commonwealth Government, such as registration of aliens, and in conjunction with the Australian Federal Police and other Commonwealth officers, they police various Commonwealth Acts and Regulations.

The Australian Federal Police was formed in October 1979 and has its headquarters in Canberra, with regional offices in each capital city and in a number of provincial towns and cities.

### Australian Federal Police—AFP

The AFP is responsible for many types of law enforcement under Commonwealth law. This includes investigations of organised crime, illegal importation of drugs, corporate crime, frauds committed on the Commonwealth (for example, social security fraud), investigation of other criminal offences committed against the Commonwealth, terrorism and breaches of currency regulations, as well as safeguarding the interests of the Commonwealth.

In the Australian Capital Territory, the AFP provides a full range of general policing services, including traffic control, special operations, search and rescue services and conventional crime investigations.

In 1984 the AFP assumed responsibility for the direction and co-ordination of Australia's coastal surveillance, response and enforcement. The Coastal Protection Unit has its Headquarters in Canberra, with regional offices in Broome, Darwin and Cairns.

The AFP also posts officers for duty overseas. Officers are located in liaison posts in Bangkok, Hong Kong, Interpol in Paris, Islamabad, Jakarta, Kuala Lumpur, London, Los Angeles, Manila, Singapore, Washington and Wellington. These liaison officers play a vital role in gathering and exchanging information. The Australian National Central Bureau of the International Police Organisation (ICPO—Interpol) in Australia is staffed by AFP officers as a service to all Australian law enforcement agencies. The AFP also has a contingent based in Cyprus as a component of the United Nations Peace-keeping Force, and officers serve as members of the Police Forces of the Australian Territories of Christmas Island and Norfolk Island.

## Police strengths

The active strengths of non-civilian police personnel in police forces in Australia are shown in the following table:

### POLICE FORCES

| Year           | AFP      | N.S.W. | Vic.  | Qld   | S.A.  | W.A.  | Tas.  | N.T. |
|----------------|----------|--------|-------|-------|-------|-------|-------|------|
| At 30 June—    |          |        |       |       |       |       |       |      |
| 1984 . . . . . | 2,911    | 10,432 | 8,507 | 4,686 | 3,286 | 2,888 | 1,009 | 640  |
| 1985 . . . . . | (a)2,477 | 10,608 | 8,444 | 4,775 | 3,373 | 2,890 | 1,019 | 662  |
| 1986 . . . . . | 2,568    | 10,743 | 8,732 | 4,872 | 3,492 | 3,168 | 1,025 | 669  |

(a) Protective services units established separately from AFP.

## Crime statistics

### Selected offences

Since 1964, the ABS has published a series of 'Selected Offences reported or becoming known to Police'. This series is provided by police, and is based as far as possible on definitions and procedural arrangements agreed to by police authorities for all States and Territories.

Graphs following show the number of offences reported or becoming known to police, including the Australian Federal Police, in Australia.

### Drug offences

Australia ratified the Single Convention on Narcotic Drugs 1961 in December 1967, and the Protocol Amending the Single Convention on Narcotic Drugs on 22 December 1972. Australia is also a signatory to the Convention on Psychotropic Substances 1971.

As its name implies, the Single Convention on Narcotic Drugs covers only the so-called narcotic drugs including cannabis and its derivatives. The Convention on Psychotropic Substances recognises that there are other drugs of dependence, and imposes controls on substances such as hallucinogens, amphetamines, barbituates, tranquilisers, and a number of other sedatives and central nervous system stimulants.

Overall responsibility for law enforcement in Australia is shared between Federal, State and the Northern Territory police forces. Each police force is an independent organisation with jurisdiction over laws of its State or Territory. Each has a drug squad or squads staffed by selected officers with special training and ability to understand the complexities of drug abuse and drug trafficking. Drug laws incorporate the controls and penalties for offences required by international drug conventions. There is co-operation between Federal, State and Territory Governments, the various police forces and other agencies to combat the serious and growing threat posed by drug trafficking. The Australian Customs Service has responsibility for the enforcement of laws controlling the illicit importing and exporting of drugs.

The following table provides information about selected drug seizures by Federal agencies during the period from 1980 to 1985.

### SELECTED DRUG SEIZURES BY FEDERAL AGENCIES

| Types of drug (grams) | 1980       | 1981         | 1982         | 1983         | 1984         | 1985         |
|-----------------------|------------|--------------|--------------|--------------|--------------|--------------|
| Opium . . . . .       | 42.80      | 168.20       | 81.87        | 1,129.50     | 40.00        | 760.00       |
| Heroin . . . . .      | 7,900.22   | 9,543.32     | 32,014.40    | 97,071.65    | 101,550.00   | 57,886.00    |
| Cocaine . . . . .     | 6,964.20   | 310.80       | 8,924.87     | 8,797.49     | 13,100.00    | 12,801.00    |
| Cannabis—all types(a) | 689,288.75 | 1,731,675.30 | 2,530,066.37 | 1,725,455.28 | 6,912,860.00 | 3,129,588.00 |

(a) Excludes seizures of plants.

In April 1985 the Commonwealth, State and Territory Governments agreed that a National Campaign Against Drug Abuse should be launched as a co-operative effort, and that all Governments would devote additional resources to the task. It was accepted that the campaign would focus particularly on the problems associated with illicit drugs. At the same time it was recognised that there are widespread health and social problems arising from the abuse of licit drugs, and that the campaign would need to cover these as well.

SELECTED OFFENCES REPORTED AND BECOMING KNOWN TO POLICE  
OFFENCES AGAINST THE PERSON INCLUDING ROBBERY

(a) From 1985-86 includes all sexual assaults and therefore not comparable with data for 1975-76 which include rape only.  
(b) From 1985-86 includes only assaults causing grievous bodily harm.

OFFENCES AGAINST PROPERTY

## Crime victims

In 1983, the ABS conducted a survey of crime victims throughout Australia. The main results were published in a special article in *Year Book* No. 70, pages 240 to 243.

## Courts

The ABS in most States and the Australian Capital Territory publishes statistics of criminal matters finalised in the courts.

## Correctional treatment of offenders

The term 'corrections' (and its derivatives) as used here refers to the treatment of offenders within the justice system.

While there is a variety in the types of correctional activities employed in each State and Territory, such activities can be broadly categorised into two groups:

- non-continuing forms of treatment, where, if the offender meets the requirements set by court, then correctional agencies would not normally become actively involved. Examples of these forms of treatment are fines, bonds, recognisances without supervision.
- continuing forms of treatment, where the offender is subject to some form of control by a correctional agency, usually for a specified period. This control may take the form of:
  - (i) full time custody, as in the case of persons detained in prisons, or other institutions, or
  - (ii) non-custodial treatment involving conditions to be observed by the offender, e.g. probation and parole. In recent years there has been a trend towards the greater use by courts of non-custodial treatment of offenders. This has seen the development of a range of programs such as periodic/weekend detention, attendance centre programs, and community service, under which the offender is at liberty in the community, but is required to report for weekend detention, training, counselling, or to perform unpaid work in the community.

Separate provisions exist in each State and Territory for the treatment of juvenile offenders, and courts and correctional agencies have a wide choice in the types of correctional treatments available to them. Both custodial and non-custodial correctional activities are employed, but greater flexibility allows treatment to be more closely aligned to individual requirements.

Each State and the Northern Territory operate prisons and other correctional services. Convicted adult prisoners from the Australian Capital Territory serve their sentences in New South Wales prisons, but local provision is made for the short-term custody of remand prisoners, and for probation and parole services. The Federal Government does not operate any prisons or other correctional services, and Federal offenders (i.e. persons convicted of offences under Federal laws) fall within the jurisdiction of State agencies for correctional purposes.

## National Prison Census

The Australian Institute of Criminology, in conjunction with State prison administrators, conducted the National Prison Census at 30 June 1985.

### NUMBER OF PRISONERS BY JURISDICTION, AGE(a) AND SEX, 30 JUNE 1985

(Source: Australian Institute of Criminology. *Australian Prisoners 1985*. John Walker and David Biles)

| Age-group                      | N.S.W.       | Vic.         | Qld          | W.A.         | S.A.       | Tas.       | N.T.       | A.C.T.    | Total         |

| <b>Total persons . . . . .</b> | <b>4,115</b> | <b>1,879</b> | <b>1,999</b> | <b>1,495</b> | <b>783</b> | <b>228</b> | <b>334</b> | <b>11</b> | <b>10,844</b> |
| <i>Total males . . . . .</i>   | <i>3,907</i> | <i>1,791</i> | <i>1,921</i> | <i>1,424</i> | <i>743</i> | <i>221</i> | <i>325</i> | <i>10</i> | <i>10,342</i> |
| <i>Total females . . . . .</i> | <i>208</i>   | <i>88</i>    | <i>78</i>    | <i>71</i>    | <i>40</i>  | <i>7</i>   | <i>9</i>   | <i>1</i>  | <i>502</i>    |

(a) The tabulation shows the age-structure of the prison populations as at 30 June 1985. The age at which persons normally become liable to imprisonment in an adult prison varies from State to State, being seventeen years in Victoria, Queensland, Tasmania and Northern Territory, and eighteen years in other jurisdictions, although younger persons who have been convicted of a particularly serious offence may also be sent to adult prisons. Persons in juvenile institutions were specifically excluded from this census.

## Criminological research

### The Australian Institute of Criminology

The Australian Institute of Criminology, located in Canberra, was established as a statutory authority under the *Criminology Research Act 1971*. The Institute is administered by a Director and a Board of Management comprising three members appointed by the Federal Attorney-General, and three members representing the States, who are appointed by the Criminology Research Council.

Among the functions of the Institute, as defined in the Criminology Research Act, are to:

- conduct criminological research (i.e. research in connection with the causes, prevention and correction of criminal behaviour and related matters), and communicate the results of such research to the Commonwealth and States;
- advise on the needs for, and programs of, criminological research, and give advice and assistance in relation to any research funded through the Criminology Research Council;
- conduct seminars and courses of training and instruction for persons engaged in criminological research or work related to the prevention or correction of criminal behaviour;
- provide advice in relation to the compilation of statistics in relation to crime;
- publish material resulting from, or relating to, its activities.

Since its inception, the Institute has undertaken directly, or through the Criminology Research Council, actively assisted in and advised on an extensive range of criminological research projects. The Institute has conducted, or been represented at, numerous national and international conferences dealing with crime related matters. In addition, the Institute maintains a comprehensive library of criminological material which is available to researchers and criminal justice practitioners.

Major recent publications of the Institute include:

- *Australian Discussion Papers for the Seventh United Nations Congress on the Prevention of Crime and Treatment of Offenders*;
- *Current Sources of Australian Criminal Justice Statistics* by Debbie Neuhaus;
- *Police Source Book*, 2nd edn, by Bruce Swanton and Garry Hannigan;
- *Burglary: A Social Reality* by Satyanshur Mukerjee and Leona Jorgensen;
- *Australian Prisoners 1985* by John Walker and David Biles;
- *Of Manners Gentle* by Dr Peter Grabosky and Dr John Braithwaite;
- *Sentencing for Break, Enter and Steal in New South Wales* by Ivan Potas.

## The Criminology Research Council

The Criminology Research Council, comprising representatives from the Commonwealth and each State, is an independent body corporate also established under the *Criminology Research Act 1971*. The Council is responsible for the control and administration of the Criminology Research Fund, which is funded fifty per cent by the Federal Government, and fifty per cent by State governments on a pro-rata population basis. Subject to the Council's assessment of a project, persons seeking to conduct criminological or related research may be provided with a grant from the fund.

Since its establishment, the Council has provided grants for over 100 separate research projects covering nearly all aspects of crime and criminal justice in Australia. Council-funded research is generally located in specific regions and may involve primary data gathering. By contrast, the research undertaken by the Institute itself is generally national and comparative in nature and makes use of existing data sources.

## Bankruptcy and copyright

### Bankruptcy

Particulars of bankruptcy in each State to the end of 1927 were incorporated in issues of the *Year Book* before No. 23. On 1 August 1928, the first Bankruptcy Act of the Commonwealth came into operation. This Act as amended was repealed by the *Bankruptcy Act 1966* which came into operation on 4 March 1968.

Under the Bankruptcy Act, the Commonwealth is divided into nine Bankruptcy Districts, of which three are in Queensland, and the remainder coincide with the boundaries of the States and of the Northern Territory of Australia. The State of New South Wales and the Australian Capital Territory together constitute one district.

The Federal Court of Australia, and a number of State courts and the Supreme Court of the Northern Territory, are all invested with jurisdiction in bankruptcy. In practice, the Federal Court exercises bankruptcy jurisdiction in the districts of New South Wales and the Australian Capital Territory, Victoria, South Australia, Western Australia, and the Southern District of Queensland. In the Central and Northern Districts of Queensland, and in Tasmania and the Northern Territory, the jurisdiction is exercised by the respective Supreme Court of the State or Territory.

Any debtor unable to pay his or her debts may present to a Registrar in Bankruptcy a petition against himself or herself accompanied by a statement of affairs. Upon their acceptance by the Registrar the debtor becomes a bankrupt. A creditor may apply for a compulsory sequestration if the debtor has committed an act of bankruptcy. The act of bankruptcy usually relied on is that the debtor has failed to comply with the requirements of a bankruptcy notice issued in respect of a debt due under a judgment or order. The prescribed form of bankruptcy notice requires the debtor, within a specified time, to pay the amount of the debt due under the judgment or order, secure payment of the debt, or compound the debt. If an act of bankruptcy is committed, a creditor may thereupon present a petition against a debtor, provided that the debt or debts amount to not less than \$1,500, the act of bankruptcy relied on has occurred within six months preceding the presentation of the petition, and the statutory requirements relating to presence or residence in Australia are applicable to the debtor.

When a debtor becomes a bankrupt, the property of the bankrupt vests forthwith in the trustee. (Certain property, known as non-divisible property, does not so vest and is retained by the bankrupt. This non-divisible property comprises items such as personal and necessary household effects, tools of trade and the like to a prescribed value, the proceeds of a claim for damages for personal injury, and the like.) Any divisible property acquired by the bankrupt during the period of bankruptcy vests in the trustee as soon as it is acquired by the bankrupt. No creditor may enforce, in respect of a debt provable in bankruptcy, any remedy against the person or property of the bankrupt, or, except with the leave of the Court, commence any legal proceedings or take any fresh step in such a proceeding.

Part X of the Act enables a debtor and his or her creditors to enter into arrangements without having a sequestration order made against the debtor. These arrangements may take

the form of a composition, a deed of assignment, or a deed of arrangement. A debtor who desires that his or her affairs be dealt with under this Part may authorise a solicitor or a registered trustee in bankruptcy to call a meeting of creditors.

The Act provides for an Inspector-General in Bankruptcy who has a range of statutory functions under the Act. In particular, the Inspector-General shall carry out inquiries and investigations at the direction of the Minister, and such other inquiries and investigations as the Inspector-General thinks fit. The Act also provides for a Registrar in Bankruptcy to be appointed for each Bankruptcy District, and for so many Deputy Registrars in Bankruptcy as are necessary. Each Registrar and Deputy Registrar has such powers and functions as are conferred or imposed on a Registrar by the Act. Powers and functions of an administrative nature are exercisable by the court as the court directs or authorises the Registrar to exercise. The Registrar may examine a bankrupt, the spouse of a bankrupt, and a person indebted to a bankrupt or having in his or her possession any of the estate or effects of a bankrupt.

There is an Official Receiver for each District and the Official Receivers together constitute a body corporate known as the 'Official Trustee in Bankruptcy'. The Official Trustee is the trustee in bankruptcy in approximately 80 per cent of the bankrupt estates occurring each year. In the remaining 20 per cent the trustee is a registered trustee in bankruptcy from the private sector.

The Bankruptcy Act was amended in 1985 by the *Bankruptcy Amendment Act 1985* which commenced operation in May 1986. As a result it became optional on the part of the petitioner, whether a petitioning creditor or petitioning debtor, to obtain the consent of a registered trustee to act as trustee of the bankruptcy. In the event that the consent of a registered trustee is not obtained then the Official Trustee becomes the trustee.

The duties of the trustee are to realize and administer the property of the bankrupt and to distribute the proceeds, in accordance with the Act, amongst those creditors who have proved their debts to the trustee. Also the trustee has a discretion to conduct an investigation into the conduct, dealings and transactions of a bankrupt, and the cause of bankruptcy.

Comprehensive statistics on bankruptcy are included in the Annual Report on the Operation of the *Bankruptcy Act 1966* which is laid before each House of Parliament by the Minister pursuant to section 314 of the Act.

## Copyright

Copyright is regulated by the Commonwealth *Copyright Act 1968* which came into force on 1 May 1969. The Act does not contain any provisions requiring or enabling the completion of formalities (such as publication, registration or the payment of fees) in order to obtain copyright protection in Australia. Protection is granted automatically from the moment of making a work or other subject matter.

The Act has been amended from time to time. The *Copyright Amendment Act 1980* and the *Statute Law (Miscellaneous Provisions) Act (No. 2) 1984*, in particular, contain substantial changes in a number of areas including fair dealings, copying by libraries and archives, and copying for educational purposes and for handicapped readers.

Copyright is administered by the Attorney-General's Department.

The *Copyright Amendment Act 1984* makes specific provision for copyright in computer software.

## CHAPTER TWELVE

# CULTURE, RECREATION, ENVIRONMENT AND TOURISM

Culture is a repository of activities drawing on a shared sense of quality of life, and takes many forms. At a national level these forms range across cultural heritage, creative and performing arts, film and video, radio and television, sports and games, and activities around the conservation and enjoyment of the natural environment.

Tourism is closely bound to cultural life. Cultural venues and events attract visitors; events and institutions are linked both to tourist patronage and to support from local populations, while a general perception of cultural vitality is an important factor in drawing visits from overseas.

This chapter reviews cultural activity supported by the Commonwealth and its agencies, and by national non-government cultural agencies.

Statistics on public participation in environment and travel, and on tourism, complementing the monitoring and promoting role of government, are also included.

### CULTURAL HERITAGE

Australia's heritage is drawn from cultural environments, both built and natural, in all their aspects. The built environment includes Aboriginal sites of all types—from cave paintings to fish-traps and carved trees. Historic places such as old residential and commercial buildings, shipwrecks, parks and gardens are also included. Natural environments range from national parks, nature reserves, habitats of endangered species and wilderness areas, to outstanding geological features and landscapes. Sites and objects of scientific, archaeological and social importance are a further component.

The functions of identifying, cataloguing, surveying and conserving national heritage are shared between governments and statutory authorities, with assistance from community organisations, such as the national trusts in each State, and individuals.

Consolidated statistics relating to cultural heritage are not available, although information on discrete activity by individual organisations is published in various annual reports and, for broader sectors, through the reports of special inquiries.

An inventory of national heritage encompasses monuments, assemblages, sites and objects, all of which have been recognised for their intrinsic value to the nation. Provision is made for their conservation in collections, parks, through preservation orders, as built monuments, structures or landscapes.

Governments support delineation and conservation of heritage material through the funding of public collections, the establishment of statutory authorities charged with providing policy advice and undertaking or sponsoring research, and administration of grants in support of heritage related activity.

While the Commonwealth Government works in partnership with State and Territory governments, it also undertakes heritage activities on its own account where implications of these actions go beyond State or local boundaries; for example the nomination of sites for world heritage listing, and the protection of Aboriginal heritage. The former function is administered by the Department of the Arts, Sport, the Environment, Tourism and Territories, the latter by the Department of Aboriginal Affairs.

### Aboriginal heritage protection

Act No. 83 of 1986 which received Royal Assent on 24 June 1986, repealed the interim provisions of the *Aboriginal and Torres Strait Islander Heritage (Interim Protection) Act 1984*. The now permanent legislation provides protection for significant Aboriginal areas and objects under threat of injury or desecration. Applications for protection may be lodged by

or on behalf of Aboriginals. Protection via a declaration may be provided where State or Territory legislation is ineffective or unavailable.

On request from the Victorian Government, the Commonwealth Government further amended the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984* by incorporating provisions for the preservation of Aboriginal cultural heritage in Victoria. The amending legislation was proclaimed on 10 July 1987.

### **Aboriginal Land Rights (Northern Territory) Act**

The *Aboriginal Land Rights (Northern Territory) Act 1976* came into operation on Australia Day 1977. The Act gives recognition to Aboriginal land rights in the Northern Territory and is based on the recommendations of the second report of the Aboriginal Land Rights Commission.

The Act, which was extensively amended in 1987, provides for:

- creation of Aboriginal Land Trusts to hold title to Aboriginal land;
- grant to Land Trusts of inalienable freehold title to Northern Territory Aboriginal reserves and some other land described in Schedule 1 of the Act (about 19% of the Northern Territory);
- investigation and report by Aboriginal Land Commissioners on Aboriginal claims to unalienated Crown land and some other land made on the basis of traditional ownership by which to date some 14 per cent of the Northern Territory has been successfully claimed;
- establishment, under the Act, of Aboriginal Land Councils to act as agents for traditional Aboriginal owners (currently the Central Land Council, Northern Land Council and Tiwi Land Council);
- control, by traditional Aboriginal owners, of mining and other use of their land;
- negotiations by the Land Councils of terms and conditions of any exploration or mining within specified time limits;
- royalty equivalents from mining operations on Aboriginal land to be paid to the Aboriginals Benefit Trust Account (ABTA). Thirty per cent is distributed to communities within the area affected and 40 per cent is paid to Land Councils to meet their administrative costs. The remaining 30 per cent is available to meet administrative costs of the ABTA and supplementary payments to the Land Councils. All royalties are to be applied for the benefit of Aboriginals living in the Northern Territory.

### **Land grant in the Australian Capital Territory**

The *Aboriginal Land Grant (Jervis Bay Territory) Act 1986*, which came into effect on 15 January 1987, provided for the granting of inalienable freehold title over 403 hectares of land in Jervis Bay Territory to the Wreck Bay Aboriginal Community Council. The Instrument of Grant was handed to the community by the Minister for Aboriginal Affairs at a ceremony on 14 March 1987.

### **Victorian land grants**

In Victoria, proposed legislation for granting land at Framlingham Forest and Lake Condah to Aboriginals was prevented from passage through the State Parliament in late 1986. The Commonwealth Government agreed to a request from the Victorian Government for legislation to be introduced into the Federal Parliament to give effect to the Victorian Aboriginal Land Bills. Subsequently, that Parliament enacted the *Aboriginal Land (Lake Condah and Framlingham Forest) Act 1987*, which received Royal Assent on 2 June 1987. This resulted in the granting of 53 hectares of land at Lake Condah and 1,100 hectares of land at Framlingham Forest to the traditional Aboriginal owners.

### **Uluru (Ayers Rock-Mount Olga) National Park (Northern Territory)**

On 26 October 1985 the Governor-General signed documents granting freehold title in Uluru (Ayers Rock-Mount Olga) National Park to an Aboriginal land trust representing the traditional Aboriginal owners. In accordance with the agreement leading to the grant, the traditional owners leased back the land to the Director of the Australian National Parks and Wildlife Service who maintains it as a national park. A Board with an Aboriginal majority

has been established which, in conjunction with the Director, oversees the management of the Park and the preparation of plans of management.

The Park was nominated for world heritage listing by the Commonwealth Government with the support of the Northern Territory Government on 31 December 1986. In June 1987, the Bureau of the World Heritage Committee recommended that the Park be inscribed on the World Heritage List.

## National estate

The Commonwealth Government, in conjunction with States and Territories, actively seeks the protection of Australia's national estate.

### National Estate Grants Program

The program is designed to help the States and Territories, and organisations within them, to conserve national estate. It is a Commonwealth Constitution 'Section 96' scheme operated under the provisions of the *Urban and Regional Development (Financial Assistance) Act 1974* and under agreements between the Commonwealth and each State and the Northern Territory.

The program is co-ordinated by the Department of the Arts, Sport, the Environment, Tourism and Territories in liaison with State and Territory authorities and the Australian Heritage Commission.

Under current arrangements, State and Territory governments have the primary responsibility for developing and administering their respective programs.

Project work is carried out by State and Territory government departments and authorities, local government bodies, academic institutions, national trusts, professional and community organisations as well as by individual consultant firms working for them.

### Australian Heritage Commission

For details on the Australian Heritage Commission and the World Heritage List, see the special article on page 488.

### National trusts

The national trust bodies were set up to further the conservation of lands, buildings, works and articles which are of heritage importance because of educational, aesthetic, historic, architectural, artistic, scientific, cultural or other special interests.

The first trust, the National Trust of Australia (New South Wales), was formed in 1945. Since then, trusts have been formed in each State, the Northern Territory and the Australian Capital Territory.

Membership of the national trusts is open to all individuals and organisations. Total membership throughout Australia is approximately 80,000.

About 300 properties are owned or controlled by the trusts. These properties include houses, nature reserves, gardens, two paddle steamers and an iron barque, an historic hamlet, and buildings which were formerly a telegraph station, a stock exchange, a powder magazine, a market, an inn, a police station, a court house, a gaol and a joss house.

The various trusts have established heritage registers which collectively list more than 23,000 places throughout Australia including buildings, urban areas, landscapes and industrial sites.

### Historic shipwrecks

Around Australia's coastline lie many old shipwrecks of historic value—the English *Trial* sunk in 1622; the Dutch *Batavia* wrecked in 1629; *HMS Sirius*, the flagship of the First Fleet of settlement lost in 1790; the Bounty mutineer chaser *HMS Pandora* wrecked in 1791; sailing ships, whalers, cutters and steamships.

Shipwrecks provide direct evidence of the exploration of Australia, of the first industries such as sealing, whaling and trading, and of the perils facing convicts and migrants who voyaged to Australia. Relics of international maritime heritage are worthy of protection, conservation and study. Their importance for education, recreation and tourism is recognised

by the Commonwealth *Historic Shipwrecks Act 1976* which applies to the coastal waters off all Australian States and Territories. Under this Act, any person finding the remains or relics of a previously unreported ship must notify its location to the Commonwealth Minister for the Arts, Sport, the Environment, Tourism and Territories. If the wreck is declared as being 'historic', the Minister is empowered to pay the finder a reward not exceeding \$50,000.

### **Protection of movable cultural objects**

The *Protection of Movable Cultural Heritage Act 1986* provides safeguards for the retention of important elements of national cultural heritage by requiring export permits for all objects of cultural significance which owners wish to send or take out of the country.

One category of objects, the loss of which would cause irreplaceable damage to Australia's cultural heritage, will not be allowed to leave, namely objects of Australian Aboriginal and Torres Strait Islander heritage comprising human remains, sacred and secret ritual objects, rock art, and carved burial trees.

Objects that may be exported (temporarily or permanently) at the discretion of the Minister of the Arts, Sport, the Environment, Tourism and Territories include:

- archaeological objects;
- objects of geological, scientific or technological interest;
- military objects;
- pieces of decorative art, fine arts, books, film and sound recordings;
- numismatic and philatelic objects;
- objects of social history.

### **National collections**

State collections of art, botanical specimens, natural history, and science and technology have a long and distinctive history. Apart from the Australian War Memorial, opened officially in 1946, the Commonwealth has only recently taken responsibility for major national collections. The Australian National Gallery and the Australian National Botanic Gardens were established as prestigious national institutions in the early 1970s, with the former occupying its present permanent site only in 1982. The National Museum of Australia and the Australian National Maritime Museum are still new institutions with emerging distinctive contributions of their own to the collection and display of heritage materials of national significance.

#### **Australian War Memorial**

The Australian War Memorial commemorates Australian servicemen and women who died as a result of wars or warlike operations, from the Sudan campaigns to Vietnam. The Memorial building opened in Canberra in 1941.

The commemorative area includes the glass-mosaic Hall of Memory, cloisters containing bronze panels of the Roll of Honour bearing 102,000 names, and the courtyard in which there is a Pool of Reflection. The names of the 30 main theatres of war in which Australian forces served are inscribed around the courtyard. The national Anzac Day and Remembrance Day services attended by the Governor-General are held at the Stone of Remembrance in front of the building. Other wreath-laying ceremonies are also conducted at the Commemoration Stone in the courtyard.

The Memorial also fulfils its commemorative role by being a significant museum, art gallery, and centre of research into Australian military history. The Memorial's vast and varied collections include over 50,000 war relics ranging from aircraft to commemorative badges, 12,000 works of art by leading Australian artists, including Nolan, Dobell, Streeton and Lambert, and 8,000 posters, as well as extensive valuable official and personal documents and audio-visual records. The Memorial houses 43 Victoria Crosses—the largest such collection in the world. The War Memorial and its surrounds were entered in the Register of the National Estate in 1981, and attract 1.3 million visitors each year.

#### **Australian National Botanic Gardens**

The Australian National Botanic Gardens occupy a 90 hectare site on the lower slopes of Black Mountain in Canberra. Over 40 hectares of this site are developed at this stage.

Officially opened in 1970, they comprise the largest living collection of Australian native plants with over 7,000 species in cultivation. The associated herbarium houses over 185,000 specimens. An annexe of approximately 80 hectares was established at Jervis Bay in 1951 to cultivate frost tender plants under more favourable conditions than those prevailing in Canberra, and to establish a collection of native plants representative of the flora of the Jervis Bay region. There are over 400,000 visits to the Gardens each year.

An information centre, educational facilities and classrooms, and the Banksia Centre with its special garden and activity programs for disabled people, are part of the community services offered by the Gardens.

Horticultural, botanical and biological research is an important aspect of the Gardens' activities and special emphasis is placed on the study and cultivation of endangered species. The Australian Cultivar Registration Authority is also based at the Gardens.

### **Australian National Gallery**

The Australian National Gallery in Canberra was established in 1975. The building was officially opened in 1982. The Gallery's aim is to acquire, conserve, research and make accessible a national collection of works of art for the benefit and enjoyment of all people. The Gallery is responsible for the national collection of Australian art and representative works of international art. To fulfil this aim the Gallery's acquisitions follow two key principles: works of art are selected on the highest aesthetic standards; and the Gallery's international collections are to complement existing public collections in Australia.

#### **Australian art**

The entire upper floor of four galleries has a permanent display presenting the full history of Australian art. The display incorporates Aboriginal art, paintings and sculptures, decorative arts, illustrated books, prints, drawings, watercolours, photographs and mural decorations.

#### **International art**

The Gallery began its collection of international art in 1972 and in a comparatively short time has acquired a range of masterpieces. They include Giambattista Tiepolo's *Marriage Allegory of the Cornaro Family*, Claude Monet's *Haystacks at Noon* and *Waterlilies*, Jean Batiste Houdon's *Bust of a Girl* and Joan Miro's *Landscape*.

### **National Museum of Australia**

The National Museum of Australia was established under the *National Museum of Australia Act 1980*. It is located on an 88 hectare site at Yarramundi on the shores of Lake Burley Griffin in Canberra.

The Museum will be Australia's first national museum of the history of this country's people and their physical environment, from earliest times to the present. The visitor centre opened on the site in September 1986. The centre contains a theatre where videos and films are screened regularly, an exhibition *On the Horizon*, and a site model where plans of the major project are displayed. A discovery trail has been developed along a scenic part of the foreshore.

### **Australian National Maritime Museum**

The Museum will be responsible for developing the national maritime collection with material reflecting the significance of maritime activity in the history and cultural life of Australia.

The Museum will be the first national collection institution to be located outside Canberra. An exhibition building is being constructed in Sydney at Darling Harbour, and is expected to be open to the public in 1988.

### **Archives and records**

While general interest in archives in Australia was aroused following the celebration of the centenary of the colony of New South Wales in 1888, it was not until the twentieth century that measures were taken for the preservation, storage and servicing of original records. Initially, major libraries throughout Australia undertook the collection of historical records,

from both official and private sources. Today, archives and records organisations exist for government records at Commonwealth and State level. Some State and Territory archives were established, since 1961, as separate authorities (New South Wales, Victoria, South Australia, Tasmania and the Northern Territory). Others remain as archives sections within State libraries.

In addition, archives have been established by some churches, business corporations, universities and city councils. The Australian War Memorial collects private material concerning Australians at war and is also a custodian of certain official Commonwealth records relating to wars or warlike operations. Other corporate and private records continue to be collected by some of the State archives offices, libraries and universities.

Many of these bodies in the archives or records field are members of the Australian Council of Archives which provides a means of promoting co-operation on issues of common concern.

### **Australian archives**

The need for a Commonwealth archival agency was recognised in 1943 when the Curtin Government appointed both the Commonwealth National Library and the Australian War Memorial as provisional archival authorities. In 1952, the Commonwealth National Library became the sole Commonwealth archival authority, and in 1961 the Archives Division of the Library was reconstituted as a separate agency known as the Commonwealth Archives Office. At this time, the Archives Office became responsible for the evaluation, disposal and preservation of Commonwealth records, for taking into custody all records no longer required for immediate reference and for regulating access to those records by research workers and other members of the public. In 1974, the Commonwealth Archives Office was renamed the Australian Archives and a Director-General was appointed in 1975. By 1974 regional offices had been established in all State capitals and in Darwin and Townsville. Services to government agencies and the public are available from this regional network. The central office of the Australian Archives is located in Canberra.

The *Archives Act 1983*, which came into effect on 6 June 1984, provides the Archives with a statutory basis for its operations and institutes arrangements for the management and proper disposition of the vast body of records created by Commonwealth agencies, past and present. The Act provides for the gathering and provision of information about Commonwealth agencies and their records; the means by which the disposal of records is authorised; and for the storage and preservation of records.

By providing a legislatively based system of public access covering Commonwealth records more than 30 years old, the Archives Act complements the provisions of the *Freedom of Information Act 1982*. Together, these two Acts provide a comprehensive system of public access covering all classes of Commonwealth records.

The Australian Archives continued computer development work during 1986-87. The Records Information Service (RINSE), a database of information about the structure and function of government agencies and about their records, and the Access Information System (AXES), designed to provide agencies and the public with information about the accessibility of record items, were implemented nationally during the year. In addition, work proceeded on prototyping applications for the Physical Control System which records and provides a range of information needed to support the management of records scheduled for transfer to, or held by, Australian Archives.

At 30 June 1987 Australian Archives' holdings throughout Australia totalled 435,560 shelf metres of records, including 173,320 metres of permanent value material. In 1986-87, 1,874 official reference inquiries from agencies were received, 273,043 items were lent or returned to departments and authorities and 280,077 items were consulted by officials in the repositories. During the same period, 6,402 public reference inquiries were received and 27,984 items were consulted by the public in search rooms. As at 30 June 1987, Australian Archives had a staff of 411 full-time operative staff.

### **National Film and Sound Archive—NFSA**

The National Film and Sound Archive was established by the Commonwealth Government in April 1984 and is located in the former Institute of Anatomy building in Canberra. The NFSA collects and preserves the moving image and recorded sound heritage of Australia, and provides a range of access services to the media industry, researchers, educators and the public.

The NFSA collection includes: 475,000 LPs (78s and 45s), 15,000 piano rolls, 10,000 phonograph cylinders, 6,000 Edison discs, 70,000 radio transcription discs, 25,000 audio tapes, 75,000 radio, film and television scripts, 50,000 film and television productions and 600,000 posters, photographs and advertising items.

The NFSA presents exhibitions on various themes related to the collection. Exhibitions are promoted interstate and there are regular screenings of films from the collection.

## LIBRARY SERVICES

The Commonwealth supports a range of library services in areas not otherwise served by State systems. These include a concentration of functions appropriate to the national reference, curatorial and bibliographic services provided by the National Library of Australia, and more specialised services provided from other government departments.

### National Library of Australia

The National Library in Canberra was formally established under the *National Library Act 1960*, which came into effect in March 1961. It was previously part of the Commonwealth Parliamentary Library. The National Library maintains and develops a national collection of library material in all subject fields and from all countries. It is also responsible for assembling a comprehensive collection of library material relating to Australia and the Australian people. In fulfilling its functions, the Library seeks to preserve books, periodicals, newspapers, government publications, pictures, prints, manuscripts, maps, music scores, and other material. Under the deposit requirement of the *Copyright Act 1968*, a copy of all printed material published in Australia is delivered to the National Library.

The Library has also been enriched by the acquisition of such notable collections as the Petherick collection of Australiana in 1911, the Cook manuscripts in 1923, the Mathews ornithological collection in 1940, the Rex Nan Kivell collection of Australian and Pacific interest in 1959, the Ferguson collection of Australiana in 1970 and the Tooley collection of rare maps of Australasia and South East Asia in 1973. The Library has a vigorous exhibition program in which regular exhibitions of paintings, prints and other historical material selected from its various collections are presented. Some of these exhibitions are sent interstate for display.

The National Library's collection of Australian and overseas material contains over 4 million volumes, including microfilms; 39,300 paintings, drawings and prints; 474,100 photographs; 6,800 shelf metres of manuscripts; 356,000 maps; 563,800 aerial photographs; 126,300 music scores; 21,250 films and video cassettes and 30,350 oral history and folklore tapes.

These materials may be used in reading rooms and in some cases are also available through the national inter-library loan system, in which the Library is a major participant. Reference services and access to computer based information services including the MEDLINE Network and the APAIS/AGP Online are provided. The Library in co-operation with other institutions provides for the development and co-ordination of library services for the disabled. The Library operates a film lending service to organisations in Australia.

The provision of central cataloguing services by the National Library achieves cataloguing economies on a national scale. The Australian Bibliographic Network, a national on-line shared cataloguing system launched by the Library in November 1981, now has over 6 million records. The Network has over 140 full participants and 550 dial-up customers from among Australia's libraries. Bibliographic records for Australian and overseas library materials are made available from the Library, both as catalogue cards and in machine-readable form. Under its Cataloguing-in-Publication program, the Library supplies cataloguing data to Australian publishers in advance of publication so that this information may be printed in the book to which it belongs. In this way, the book and its cataloguing data are available simultaneously to libraries, booksellers, bibliographers, and all others who need such data.

Co-operative bibliographical activity includes recording the holdings of the major Australian libraries in the National Union Catalogue of Australia, which is a series of specialised union catalogues maintained in the National Library for monographs, serials, newspapers, manuscripts, music, oriental language materials and library materials for the handicapped. At intervals they are published, and progressively they are becoming available on-line. The series

of catalogues is described in the *Guide to the National Union Catalogue of Australia*, 7th edition, 1987.

The Library is a partner with the State Library of New South Wales in the Australian Joint Copying Project, which microfilms records relating to Australia, held in Great Britain and elsewhere.

A particularly important contribution to the National Library's role in the library community is its participation in two national consultative bodies. The Australian Advisory Council on Bibliographical Services is a co-operative association of libraries and other information agencies which seeks to encourage co-operation and the development of resources and services. The National Library provides the secretariat and meets the administrative costs of the Council's Standing Committee. The Director-General is the Library's representative on the Australian Libraries and Information Council which advises Commonwealth and State Ministers with responsibilities for the arts and cultural affairs on the nation-wide co-ordination of library and related information services.

## **Other Commonwealth libraries**

### **Patent Office Library**

The library of the Australian Patent, Trademarks and Designs Office in Canberra contains approximately 14,000 books and a wide variety of periodicals and other literature relating to science, technology, industrial property (patents, trademarks and designs), law and practice. The collection dates back to 1904, ensuring that its holdings of patent gazettes, journals and specifications are reasonably comprehensive. Patent specifications of inventions are received from the principal countries of the world. Present holdings are over 15 million with an estimated 600,000 patent specifications received annually. Document back-up is available through the sales centre.

Australian and some foreign specifications and related material are also available at sub-offices in Brisbane, Sydney, Melbourne, Adelaide, Perth and Hobart.

### **Commonwealth Scientific and Industrial Research Organisation—CSIRO**

The Information Resources Unit (IRU), a component of the Bureau of Information and Public Communication, was formed in 1986 by the amalgamation of the CSIRO Central Library and the Central Information Service. Its objectives are to provide enhanced library and information resources for CSIRO scientists, and to improve marketing of information to the Australian science and technology industry.

The IRU complements and extends the information program in the CSIRO divisions where research takes place and is also the co-ordinating centre for the library network of over 40 libraries in divisions located Australia-wide.

The activities of the IRU are reported with all other units in the Annual Report of the Bureau of Information and Public Communication. This publication supersedes CILES' Report.

### **The Australian War Memorial Documentary and Audio-visual Records Centre**

The Centre preserves the documentary and pictorial records of Australia's participation in armed conflicts. Printed audio and other material includes over 80,000 volumes (books and bound periodicals); thousands of unbound periodicals, leaflets, souvenir and microfilm items; a large collection of military maps; newscuttings and newspapers; sound recordings; war posters; postage stamps; and currency. Official records and personal papers occupy almost 2,000 metres of shelving. Official war photographs covering World War I, World War II, the Korean and Vietnam wars number over 670,000, and there are about 1.5 million metres of cinefilm. Facilities exist for reference and research.

### **Commonwealth Parliamentary Library**

The Library provides comprehensive information and research services to the Commonwealth Parliament through the Legislative Research Service and the Library, Reference and Information Service. The Research Service comprises groups staffed by subject specialists who prepare analyses and interpretations of specific issues with which the Parliament is or may be concerned. The Library, Reference and Information Service answers questions and

provides information from printed and other published sources. The Library collection is concentrated on topical material, supported by a wide collection of standard references; it totals some 150,000 volumes, including 9,000 serial titles. The Library publishes the *Commonwealth Parliamentary Handbook*, which is a standard reference work, topical annotated reading lists, general research papers from the Legislative Research Service, digests of bills and, in alternate weeks the *Index to Current Information* and *Select List of Acquisitions*. Extensive use is made of computer and on-line services, particularly in such areas as economic and electoral statistics and in the provision of information by librarians.

### **Australian Bureau of Statistics Library**

The ABS Library in Canberra has a large collection of material on statistical methodology as well as year books, census reports and statistical bulletins from many countries and international agencies, covering periods in some cases from the turn of the century.

### **Departmental libraries**

Each government department has a library or information unit to service its department's needs. Some of these libraries are available for public use.

## **Other libraries**

### **State and municipal libraries**

Most municipalities and shires have libraries funded by the local council with some State government assistance. A detailed description of libraries funded directly by the States is given in the respective *State Year Book*.

### **Children's libraries and school libraries**

Children's libraries exist in all States, usually as branches or extensions of municipal libraries.

### **University and college libraries**

The Commonwealth Government has, since 1957, supported the development of university and college of advanced education libraries.

## **CREATIVE ARTS**

The arts in Australia receive considerable financial support from the Commonwealth Government. This support is complemented by State, Territory and local governments. Governments provide funds for virtually all aspects of creative artistic life. Major arts facilities have opened in Canberra, Sydney, Melbourne, Brisbane, Perth, Adelaide and Darwin. The number of regional art museums and performing arts centres has increased in recent years. In the past decade the number of major international art exhibitions touring capital cities has increased. Community and folk arts have gained recognition, and the Australian film industry is emerging once again as a major contributor, in economic and artistic terms, to Australian cultural life.

The activity of governments in encouraging and supporting culturally important activities is complemented by non-government sponsors, organisers, entrepreneurs and patrons of the arts. Private and corporate investment in the arts is being encouraged, and joint ventures between government and corporate sponsors for large scale events, tours or exhibitions are not uncommon.

### **National activities**

The Commonwealth Government formulates policy guidelines for the support of the arts generally and allocates funds annually to the national arts institutions under its jurisdiction. Commonwealth/State consultation on cultural matters takes place through such bodies as the Cultural Ministers Council, the Australian Libraries and Information Council and the Advisory Committee on National Collections.

## Australia Council

The Australia Council is the Commonwealth Government's chief funding body and policy adviser for the arts. Established as a statutory authority in 1975, its responsibilities are detailed in the *Australia Council Act 1975*. Broadly speaking, the Council's brief is to formulate and carry out policies to help raise the standards of the arts in Australia, to enable and encourage more Australians to become involved in the arts and to enable Australians and people in other countries to become aware of Australia's cultural heritage and achievements. Artists and arts organisations are assisted financially by the Council through its specialist art form boards.

In May 1987, the Government announced changes to the structure of the Australia Council in response to the Report of the House of Representatives Standing Committee on Expenditure Inquiry into Commonwealth Assistance to the Arts (the McLeay Report), to revitalise arts support mechanisms and policies for the next decade. Under the new arrangements, the Council is to consist of fifteen members made up of the Chair of Council, all chairs of Boards, arts practitioners and representatives of the broad public interest, and Council's General Manager as an ex-officio member. The number of Boards has been reduced from eight to five, and covers the literary arts, visual arts and craft, design, the performing arts and Aboriginal arts. The Boards are also to be representative of artistic and broad public interests.

### Community cultural development

A new Community Cultural Development Unit is to be formed to elevate the Council's Community Arts focus and provide for integration with the activities of the artform boards. The functions and funding role of the former Community Arts Board will transfer to the new unit which will have a broader brief to foster community cultural development. Council will have ultimate responsibility for community arts development, and will assist community involvement by encouraging the development of the closer integration of arts practice into everyday life and growth of an independent culture that reflects the diverse composition of Australian society.

The Community Cultural Development Unit will also administer programs in support of Multicultural Arts, Youth Arts, Touring and Access and Art in Working Life.

#### ALLOCATION OF FUNDS FOR PROGRAMS, BOARDS AND ADMINISTRATION OF THE AUSTRALIA COUNCIL, 1986-87 (\$'000)

|                                             |               |
|---------------------------------------------|---------------|
| <b>Boards—</b>                              |               |
| Aboriginal Arts . . . . .                   | 2,897         |
| Community Arts . . . . .                    | 3,584         |
| Crafts . . . . .                            | 2,245         |
| Design . . . . .                            | 680           |
| Literature . . . . .                        | 3,160         |
| Music . . . . .                             | (a)12,265     |
| Theatre . . . . .                           | (b)13,363     |
| Visual Arts . . . . .                       | 2,451         |
| <b>Total boards</b> . . . . .               | <b>40,645</b> |
| <b>Programs—</b>                            |               |
| Advocacy . . . . .                          | 20            |
| Arts Information . . . . .                  | 475           |
| Inter-board . . . . .                       | 1,598         |
| International . . . . .                     | 187           |
| Policy and Research . . . . .               | 305           |
| Touring and Access . . . . .                | 647           |
| <b>Total programs</b> . . . . .             | <b>3,232</b>  |
| <b>Total support for the arts</b> . . . . . | <b>43,877</b> |
| Administration . . . . .                    | 6,694         |
| <b>Total appropriation</b> . . . . .        | <b>50,571</b> |

(a) Includes \$4,490,000 for the Australian Opera and \$3,978,000 for Orchestras.  
(b) Includes \$2,148,000 for the Australian Ballet.

## **Aboriginal arts**

The Aboriginal Arts Board supports activities involving the preservation and continuation of traditional cultural practices and their associated arts forms, as well as the generation of new artistic expression among Aboriginal people in urban and country areas.

## **Design**

The Design Board provides a focus for design activity in Australia. A major part of its work is to promote the value and principles of design to the widest possible audience. While the Board's activities and grants program are primarily directed to projects at present, support for professional development and for individuals has been identified as a future area of concern.

## **Literary arts**

The Literary Arts Board, formerly the Literature Board, encourages all forms of Australian creative writing through direct grants to writers, and the subsidising and promotion of the resultant works. More than half of the Board's annual expenditure goes in grants to writers to meet travel, research and other expenses.

## **Performing arts**

The new Performing Arts Board, integrating the former music and theatre boards, facilitates consideration of issues common to the performing arts such as training, performance venues and administration. The board will also continue to encourage and support the development of music in Australia and the promotion of Australian music and musicians overseas, and the development of performance, content and production of dance, drama, puppetry, mime and young people's theatre, which stems from and relates to the Australian experience.

Australia has eight fully professional orchestras managed by the Australian Broadcasting Corporation namely a symphony orchestra in each State capital city. The other two orchestras, the Elizabethan Sydney Orchestra and the State Orchestra of Victoria, are predominantly engaged in work with the Australian Opera (Sydney) and the Australian Ballet (Melbourne). The Board provides continuing support for some 80 drama, dance, puppetry, mime and youth companies and provides opportunities for professional theatre people to develop their skills, encourages growth in theatre attendance and promotes community involvement in live theatre.

## **Visual arts/craft**

The Visual Arts/Craft Board has been designed to link related, but distinct art forms. The Board continues the work of the former Visual Arts Board in providing assistance to individuals and organisations working across a wide spectrum of the visual arts in Australia, from painting and sculpture to museology. Programs include grants to individuals, the commissioning and placing of works of art in public places, research and writing on the visual arts, support for artists in residence and the acquisition, exhibition and conservation of works of art.

In the area of crafts, the Board encourages continuing improvement in the quality of crafts practised in Australia, and provides greater opportunities for craftspeople to further their professional development. It fosters wider community access to the crafts and promotes an awareness of Australian crafts overseas and of work of other countries in Australia.

## **Other Commonwealth schemes in support of the arts**

### **Artbank**

Artbank is a unit of the Department of the Arts, Sport, the Environment, Tourism and Territories, set up to encourage young Australian artists through the purchase and public display of their work, thereby complementing other Commonwealth art support schemes. Since its inception in 1980, the Artbank collection has grown to more than 5,000 works, including paintings, artists' prints, sculpture, photography, Aboriginal art, and craft. Approximately 1,500 artists are represented in the collection.

### **Taxation incentives for the arts**

The Taxation Incentives for the Arts Scheme came into operation on 1 January 1978 under section 78 of the *Income Tax Assessment Act 1936*. The scheme encourages the donation of gifts in kind to public art galleries, museums and libraries by allowing donors a taxation deduction.

### **Historic Memorials Committee**

The Historic Memorials Committee was established in 1911 to secure portraits of distinguished Australians who took an active part in Federation. Later the Committee decided to obtain portraits or other representations of all Governors-General, Prime Ministers, Presidents of the Senate, Speakers of the House of Representatives, Chief Justices of the High Court of Australia and other distinguished Australians. In addition, the Committee has commissioned paintings or other representations to record special events connected with the Commonwealth Parliament and, more recently, the High Court of Australia. The collection is located in Parliament House.

### **Commonwealth indemnification of exhibitions**

In 1979 the Commonwealth introduced a scheme under which national and international touring art exhibitions could be approved for Commonwealth indemnity against loss or damage of the works involved. The scheme ensures that the Australian public has the opportunity to see major international and Australian touring art exhibitions which would be uneconomic without indemnity due to the prohibitive cost of insuring such major works. The scheme also covers Australian exhibitions travelling overseas, sponsored by the Australia Council, for which indemnity is not available from the host country and without which Commonwealth indemnity could not proceed.

Thirty-seven exhibitions were indemnified by the Commonwealth between 1979 and 1987. They ranged from traditional Aboriginal artefacts through ancient Chinese and European archaeological finds to paintings, prints and drawings from a wide variety of countries, styles and schools.

### **International Cultural Corporation of Australia Limited—ICCA**

ICCA was established by the Commonwealth Government in 1980 as a non-profit public company to arrange and manage international exhibitions and events of art and culture.

Its principal activities are three-fold. Firstly, working in close collaboration with Australian and overseas galleries and museums, it brings to Australia significant exhibitions of artistic, cultural and historical interest. Secondly, it works with the Australian Government to send exhibitions of Australian art and other examples of national cultural achievements overseas. Thirdly, it offers consultancy and advice to Commonwealth, State and overseas governments, and to galleries and museums.

To date, the corporation has managed 25 exhibitions and events, among them, 16 major touring exhibitions. Total audiences have exceeded 3 million.

The Australian Government provided funds totalling \$1 million between 1980 and 1983, but since then the corporation has been self-supporting. ICCA has attracted \$8.5 million of sponsorship support—from 31 companies and 13 public sector sources.

ICCA works in close collaboration with the Department of the Arts, Sport, the Environment, Tourism and Territories through which it operates the Australian Government's Indemnity Scheme. ICCA also works with the Department of Foreign Affairs and Trade, the Australia Council and other government and cultural agencies in Australia and overseas. Its continuing contractual partners in exhibition activities are the Australian galleries and museums.

### **Public Lending Right Scheme**

The Public Lending Right Scheme, established by the Commonwealth Government in 1974, makes compensatory payments to Australian authors and their Australian publishers for the use of their books in public lending libraries. Eligible books must be created by Australian citizens and residents and meet certain eligibility criteria.

The scheme aims to resolve the apparent conflict between providing a free library system

and ensuring that Australian writers, editors and other creators receive a fair payment for the use of their books.

The scheme's annual payments amount to approximately \$1.9 million. Payments to authors and publishers are based on annual sample surveys of bookstocks of public lending libraries throughout Australia.

## Other arts organisations

### Arts Council of Australia

The Arts Council of Australia is a community based incorporated body funded through the Australia Council and State government arts authorities. The Central Secretariat of the Council is in Sydney, with divisions in all States and Territories.

The Council's historical role has changed over the last few years. Access to and participation in a much wider range of arts experiences is provided through tours by State theatre, opera and ballet companies, local festivals and workshops, theatre-in-education teams and artists-in-residence. The voluntary committees, which number about 250 throughout Australia, receive support, help and training from the nine professionally-staffed head offices.

The Council also administers grants on behalf of other bodies such as the Australia Council and State arts authorities.

### Australian Elizabethan Theatre Trust

The Australian Elizabethan Theatre Trust, established in 1954, was originally formed to present drama, opera, ballet and puppetry throughout Australia. Full autonomy has been accorded to most of the performing companies established by the Trust. The Trust's major functions are to administer the Elizabethan Theatre Trust Orchestras; to act as entrepreneur in the touring of theatre features from overseas and Australian sources; and to provide general services, including tax deductibility for donations, for theatre organisations.

The Trust receives annual grants from the Australia Council and State and local governments. Its revenue is supplemented by subscriptions, donations and its own activities.

### The Australian Ballet

The Australian Ballet, established in 1961 as the national classical ballet company of Australia, first performed in Sydney on 2 November 1962 and was registered as an incorporated company in 1970.

Fifty-six dancers perform on stage supported by 33 artistic, music, production and theatre staff and 27 marketing, publicity, administrative and finance staff—a total of 116.

The Australian Ballet gives about 185 performances every year in the Australian cities of Sydney, Melbourne, Brisbane, Adelaide and Perth and has toured overseas regularly. Tours since 1965 are listed below.

|         |                                                                   |
|---------|-------------------------------------------------------------------|
| 1965    | Royal Opera House and Covent Garden, London and Baalbeck, Lebanon |
| 1967    | North and South America                                           |
| 1968    | South East Asia                                                   |
| 1970-71 | United States of America                                          |
| 1971    | Singapore and Philippines                                         |
| 1973    | U.S.S.R., Eastern Europe and London                               |
| 1976    | New York, Washington, London and Philippines                      |
| 1978    | Jakarta                                                           |
| 1979    | Greece, Israel and Turkey                                         |
| 1980    | The People's Republic of China                                    |
| 1981    | Mexico                                                            |
| 1987    | Japan and China                                                   |

The Commonwealth and State Governments of Australia provide yearly grants to the Australian Ballet, contributing 22 per cent of its total income, but its main source of revenue is ticket sales which bring in more than \$6 million. Many businesses and commercial organisations provide sponsorships which total in excess of \$1 million. Operating costs exceed \$10 million per annum. Orchestras for Australian performances are funded by government grants and conducted by the Australian Ballet's music director and guest conductors.

## Festivals

The number of festivals devoted solely or partly to the arts now totals about 400 a year. The two biggest are Adelaide's biennial and Perth's annual festivals, both of which last several weeks and present overseas artists as well as leading Australian companies.

Many country centres now have arts festivals which attract performers and artists from a wide area. Seminars, arts workshops and community participation programs are increasingly popular.

## The Australian Opera

The Australian Opera is the largest performing arts organisation in Australia, employing over 200 permanent staff including 31 principal singers and a chorus of 48. In addition, it employs over 500 casuals each year, including a number of celebrated international singers. The projected budget for the Opera in 1988, excluding the cost of orchestras, is over \$23 million. This is derived from the following sources—59 per cent box office and other earned income, 26 per cent government subsidy, and 15 per cent private contributions. The Opera, with headquarters in Sydney, tours annually to Melbourne and Brisbane. Opera performances in the parks and on television and radio are increasingly being utilised by the company to provide all Australians with access to opera.

## Musica Viva

Musica Viva Australia is Australia's national chamber music entrepreneur. A non-profit company founded in 1946, it presents concerts mainly of chamber music but also of other types of fine music by Australian and overseas artists.

Musica Viva receives subsidies from the Performing Arts Board of the Australia Council and several State governments, with the balance of its income coming from ticket sales, sponsorship and donations.

It also manages tours by Australian artists overseas, often in association with the Department of Foreign Affairs and Trade, operates an extensive program in education, and commissions new music from Australian composers. In 1987, Musica Viva presented over 1,500 concerts throughout Australia and overseas.

## Film and television

Encouragement of the Australian film industry is a firm policy objective of the Commonwealth Government. The following funds were allocated to film-related organisations in 1986-87:

- Australian Film Commission—\$20.7 million (includes \$6 million for the special production funds);
- Australian Film, Television and Radio School—\$8.5 million;
- Australian Children's Television Foundation—\$0.5 million.

## Australian Film Commission

The Australian Film Commission is a statutory authority established in 1975 to encourage the development and growth of an indigenous film industry.

The Commission addresses this responsibility by managing the expenditure of over \$28 million on film production and financial assistance to independent film makers, by offering a legal, business and marketing advisory service, and by producing films for government departments and programs in the national interest.

The Film Development Division, through the Script Office and various funds (Creative Development, Special Production, No Frills, and Women's Film Funds), provides financial support to individuals for script development and production, and offers financial facilities for projects entering production. In addition to these responsive funds, specific programs have been introduced to target particular industry needs. These programs concentrate on developing skills with a select group of film makers. They include a Documentary Fellowship, a Producer Support Scheme and a Comedy Fund.

Film Australia is being re-established as a wholly owned government company as the Commonwealth's film and video production unit, producing about 80 projects (predominantly documentaries) each year, which are marketed in over 26 languages. Programs are made for

client Government departments, and on a range of social, cultural, educational and scientific issues. Film Australia distributes its programs widely to the education market, government film libraries, and television networks in Australia and overseas.

Twenty-eight features, 21 telemovies and thirteen mini-series were produced outside the television networks in 1986-87 for approximately \$148 million.

In 1986, cinema admissions increased by 11 per cent on 1985 figures, with approximately 35.5 million attendances. Australian films claimed a 17.7 per cent share of the gross box office in capital cities.

### **Taxation Incentives for Films Scheme**

The scheme which is embodied in Division 10BA of the *Income Tax Assessment Act 1936* was established in October 1980 to encourage private investment in Australian films. The scheme allows taxation concessions for private investors in qualifying Australian films which have been issued with a certificate to that effect by the Commonwealth Minister for the Arts, Sport, the Environment, Tourism and Territories.

Qualifying Australian films are feature films and films of a like nature for television (telemovies); documentaries; and mini-series of television drama. Further they must be produced principally for public exhibition in cinemas or on television, be substantially made in Australia and have a significant Australian content.

Film budgets totalling \$179.7 million were secured by investment under the scheme in the 1986-87 financial year.

### **Australian Children's Television Foundation**

The Australian Children's Television Foundation was incorporated in Victoria in March 1982. Its aim is to improve the quality and quantity of children's programs on Australian television. It has actively pursued this objective by investing in script development and program production and by undertaking related educational and informational activities. The Foundation receives assistance from Federal, State and Territory Governments (with the exception of Queensland). In 1986-87, \$0.5 million was provided by the Commonwealth with a matching contribution sought from the other participating governments on a State/Territory per capita basis.

### **Film censorship**

The Commonwealth's censorship powers derive from Section 51 (1) of the Constitution, which enables the Commonwealth to regulate trade and commerce under the Customs Act. Section 50 (1) of the latter Act provides that the Governor-General may, by regulation, prohibit the importation of goods into Australia. The Customs (Cinematograph Films) Regulations, which establish the Film Censorship Board and define its legislative role and functions, flow from that Section.

The Board is a full-time statutory body located in Sydney. Regional censorship officers, with limited powers and functions, are located in Canberra, Melbourne, Brisbane, Adelaide and Perth. The Board is administered by the Attorney-General's Department.

Under the Customs (Cinematograph Films) Regulations, the Board examines imported films and videotapes to determine whether to register or to refuse to register them for public exhibition. It also examines film advertising. The Regulations direct the Board not to pass films or advertising matter which in its opinion are:

- blasphemous, indecent or obscene;
- likely to be injurious to morality, or to encourage or incite crime;
- undesirable in the public interest.

The Board's State functions in relation to cinema films, including classification, are performed by virtue of formal agreements with the various States. Decisions on matters arising under the Regulations and on classifications under State/Territory legislation may be appealed to the Films Board of Review.

### **Feature films**

In 1986, 632 feature films were processed. Twelve feature films were refused registration and deletions made in 5. There were 16 appeals, of which 11 were upheld and 5 dismissed. Of 632 features, 55 were classified For General Exhibition ("G"), 163 Parental Guidance ("PG") 210 For Mature Audiences ("M") and 82 For Restricted Exhibition ("R"). Permis-

sions to import for use at film festivals were granted to 107 films, and 3 were passed subject to special conditions.

The principal countries of origin were United States of America (248 films), Hong Kong (92 films), United Kingdom (62 films), Japan (40 films), Australia (33 films) and France (30 films).

While the "M", "PG" and "G" classifications are advisory, persons who have attained the age of two years and who have not attained the age of 18 years are excluded by law from seeing "R" rated films.

#### **Videotapes**

The Board examined 2,335 television features for sale or hire in 1986. There were 13 appeals, 9 upheld and 4 dismissed. 583 feature titles were classified "G", 402 "PG", 544 "M", 382 "R" and 347 "X". 77 were refused classification. The "X" classification is applied only to videotapes in the A.C.T. and Northern Territory which contain non-violent explicit sexual material. Such material is prohibited in the States.

### **Professional training in the arts**

Professional training in the arts in Australia covers a broad range of resources. Training is available through formal educational programs in TAFE, advanced education and university level courses. There are also a number of on-the-job training programs available in the arts. Very few national institutions deal specifically with professional training in the arts.

#### **National Arts Industry Training Committee Limited—NAITC**

The Committee was established in 1986 as a national organisation dealing specifically with vocational training needs in the arts industry. NAITC is not a training organisation in itself, but aims to ensure that training meets present and future needs of those involved in the arts. The Committee undertakes a number of activities to achieve its aims. NAITC encourages dialogue within the arts community about training needs and develops programs based on these discussions. It acts as an important resource centre on information regarding available training in Australia. NAITC undertakes a series of research projects to examine specific training needs in different sectors of the arts industry. These have included the investigation of training for industrial design, live theatre technicians and management skills training for the rock industry. NAITC liaises with State and Federal Government, educational institutions and others involved in policy making for arts training and so acts as an advocacy body. NAITC is a tripartite organisation, consisting of employers, employees and Federal Government representatives. Membership includes organisations involved in film, television, literature, design, crafts, performing and visual arts. The Commonwealth provides funds for NAITC through the Department of Employment, Education and Training. Additional funds in the form of financial contributions and in-kind support from the arts community supplement government grants.

#### **Australian Film, Television and Radio School**

The School was established in 1973 as an Australian Government statutory authority. It is responsible for providing advanced education and training for industry professionals, as well as the development, through its full-time and short courses, of outstanding new talent.

The School undertakes, co-ordinates and disseminates research in connection with the production of programs. Training needs are assessed and employment trends in the industry are evaluated. The School maintains an extensive library of print and non-print material related to film, television and radio.

#### **National Institute of Dramatic Art—NIDA**

The Institute is Australia's national training school for young people who wish to enter the profession of theatre, film and television as actors, directors, designers or stage managers. The Institute's courses are designed to meet the needs of the arts entertainment industry by assisting students to develop the craft skills, cultural background and arts discipline required for successful careers in their chosen field.

The Institute's students number approximately 130 and it has a staff of 30 full and part-time teachers. Each year, some 50 new students are enrolled from over 1,500 applicants from throughout Australia.

## RECREATION, FITNESS AND SPORT

The Department of the Arts, Sport, the Environment, Tourism and Territories has a general responsibility in the national sphere for recreation, fitness and advice on sport policy.

All State governments have also established agencies with special responsibilities for recreation and sport. Increasing numbers of local government authorities are employing recreation workers who are responsible for planning the use of recreation facilities, and for devising recreation programs.

### National activities

The Sport and Recreation Ministers Council (SRMC) provides the major mechanism for liaison between the Commonwealth, State and Territory governments on matters concerned with sport and recreation in Australia. The Council is a forum for consultation and co-operation between the respective governments, and its membership comprises the Ministers with prime responsibility for sport and recreation. Both New Zealand and Papua New Guinea have observer status on the Council.

The SRMC is assisted by the Standing Committee on Recreation and Sport (SCORS). The Department provides secretariat support to the Council, the Standing Committee and its sub-committees.

### Standing Committee on Recreation and Sport—SCORS

The Standing Committee comprises representatives from the Commonwealth, State and Territory departments or agencies responsible for sport and recreation. It has established two permanent sub-committees; the Sub-committee on Fitness and the Consultancy Fund Sub-committee.

The objectives of the Sub-committee on Fitness are to:

- provide a mechanism by which the Commonwealth, State and Territory departments can support and assist each other in developing fitness programs;
- provide advice to SCORS on:
  - matters relating to fitness;
  - areas of co-operation in planning, implementing and evaluating fitness programs, facilities and services;
- undertake specific tasks in the area of fitness as directed by SCORS;
- initiate, in conjunction with other agencies where appropriate, approved projects relating to fitness.

The Consultancy Fund Sub-committee is generally responsible for advising the Standing Committee on the operation and management of the SRMC Consultancy Fund. The Consultancy Fund has been established jointly by the Commonwealth, State and Territory Governments to enable the council to undertake, on a co-operative basis, projects of common interest.

The Consultancy Fund Sub-committee is responsible for:

- advising SCORS on an annual program to be funded from the SRMC Consultancy Fund;
- implementing projects in accordance with the approved funding program;
- monitoring the progress of projects and presenting reports and recommendations;
- advising SCORS on the dissemination and publication of the results of such projects.

Projects funded from the Consultancy Fund include: an evaluation of the economic impact of the World Cup IV in athletics; the preparation of a booklet for use by sporting organisations on talent development; a study into the employment potential of recreation, sport and fitness in Australia; an evaluation of the effectiveness of the national coaching accreditation scheme; and a study into the social, economic and sporting benefits of hosting specific major international sporting events in Australia.

The Standing Committee has also set up several ad hoc working parties to provide advice on matters of specific concern in the area of sport and recreation.

### Recreation and Fitness Program

In 1986-87, \$610,000 was provided to assist in increasing opportunities for participation in safe recreation and fitness activities under this program.

### **Fitness of Australian youth**

Between 1984 and 1986, the Commonwealth provided \$327,000 in grants to the Australian Council for Health, Physical Education and Recreation (ACHPER) to conduct a national survey of the fitness, health and physical performance of Australian school children. The survey provided benchmark data on the health and fitness of young Australians against which the future effectiveness of health and fitness programs can be measured. Since then, the Commonwealth has provided \$100,000 in grants to ACHPER to assist the development of national fitness awards for school children. The awards will encourage participation in regular physical activity and reward achievements at various levels.

### **Employee fitness, health and recreation**

Following earlier initiatives in this area, the Commonwealth has developed an information package on workplace fitness programs entitled 'Health and Fitness at Work—It Works'. This comprises a video and card series which describes successful Australian workplace programs and a booklet for guidance in the establishment of health and fitness activities in the workplace.

### **Community fitness and recreation**

Between 1984 and 1987, the Department of Arts, Sport, the Environment, Tourism and Territories conducted several national surveys on the physical activity and recreation patterns of Australians. This information has assisted in identifying factors associated with active and inactive Australians, and provided a basis for both planning and evaluating programs. A number of reports on survey results have been published. A national conference will be held in 1988, to develop a national action plan for the promotion of physical activity and other aspects of a healthy lifestyle.

### **National sports facilities program**

Between 1984-85 and 1987-88 the Commonwealth has spent \$32.8 million on the construction of international standard sports facilities under the National Sports Facilities Program.

The aim of the program is to encourage and assist with the construction of a range of sporting facilities to give Australian athletes the opportunity to train and compete on a similar basis to their overseas counterparts and enable Australia to be more successful in attracting international competition.

### **Sport and recreation for people with disabilities**

The National Committee on Sport and Recreation for the Disabled (NCSRD) was established in 1981 to advise the Minister on matters relating to the development of sport and recreation for disabled people. Its primary function is to make recommendations to the Minister responsible for sport and recreation on:

- priority areas for the development of sport and recreation for disabled people;
- allocation of funds provided to assist sport and recreation for disabled people.

The Department of the Arts, Sport, the Environment, Tourism and Territories administers the Program of Assistance for Sport and Recreation for Disabled People (PASRDP) based on advice from the NCSRD. The program has the aim of assisting national sporting and recreation organisations for people with disabilities and providing sport and recreation opportunities for disabled people.

The following table outlines the allocation of program grants by category in 1986-87.

**GRANTS TO PASRDP, 1986-87**

|                                     | \$             |
|-------------------------------------|----------------|
| Administration                      |                |
| General . . . . .                   | 44,700         |
| Personnel . . . . .                 | 137,000        |
| National Championships . . . . .    | 34,070         |
| International                       |                |
| Competition . . . . .               | 192,900        |
| Meetings . . . . .                  | 21,375         |
| Integration . . . . .               | 33,940         |
| Junior Sports Development . . . . . | 25,000         |
| Recreation Projects . . . . .       | 115,001        |
| <b>Total . . . . .</b>              | <b>603,986</b> |

In 1986-87, \$825,000 was allocated to the program. A total of \$603,986 was granted to various sport, recreation and community organisations involved in the provision of sport and recreation services and programs for disabled people, and \$30,000 for a national seminar on junior sports development for people with disabilities.

Two new programs designed to assist disabled sports people were implemented in 1984-85. They were the National Disabled Athlete Award Scheme (NDAAS) and the Elite Disabled Athlete Assessment Centre Program (EDAACP).

The objective of NDAAS is to encourage high performance disabled athletes to continue their involvement in sport and maintain or improve performance levels. The scheme provides direct financial assistance to individuals to defray costs associated with competition, training and travel. \$72,000 was allocated to NDAAS in 1986-87, and in 1987 grants were awarded to 23 disabled athletes.

EDAACP, now entitled DAACP, was established as a 3-year pilot study. The program is designed to offer disabled athletes access to physiological and psychological assessment facilities, as well as to provide high level disability-specific coaching advice. The program was allocated \$91,814 in 1986-87.

### **Australian Institute of Sport—AIS**

The Australian Institute of Sport was established in 1980 to provide high performance athletes with the opportunity to develop their sporting potential through first class coaching, in international standard facilities and with access to scientific and medical support. For its first 6 years, the Institute functioned as a public company. On 1 January 1987, the Institute became a statutory authority.

In 1986-87 scholarships were provided to 303 high performance sports people in 14 sports—basketball, cycling, diving, gymnastics, hockey, netball, rowing, soccer, squash, swimming, tennis, track and field, water polo, and weightlifting. Sportsmen and sportswomen attending the Institute are also able to undertake secondary or tertiary education or obtain regular employment.

The AIS Board of Management, appointed by the Minister responsible for sport, develops the Institute's policy and priorities. At the end of June 1987, the AIS had a staff of 168, comprising 101 administrative staff, 41 sports coaches and 26 sports science/sports medicine personnel. The Institute's headquarters are located at Bruce in the Australian Capital Territory. Decentralised units have been established in Perth to cater for hockey, Brisbane for squash and diving, and Adelaide for cycling.

In 1986-87 the Government provided \$12.7 million to cover the operational, development and facility management costs of the Institute. In addition to the resident sports program, the Institute administers the National Sports Program (formerly the National Training Centre Program), which offers sportsmen and sportswomen the opportunity to use the AIS facilities, resources and expertise for national selection trials, team training, talent development programs, coaches' seminars, and workshops for sports officials. Overseas athletes and coaches regularly visit the Institute.

### **Australian Sports Commission**

The Australian Sports Commission (ASC) was established on 1 July 1985 as a statutory authority, with the aim of providing leadership and long term direction for the future development of sport in Australia. A principal objective is to assure continuity and stability of sports development.

In 1986-87 the Government provided \$9.6 million for the Commission's program and administrative expenses. Included in the budget for 1986-87 was \$7.3 million for the Sports Development Program.

The objectives of the Australian Sports Commission reflect directly the reasons for the establishment of the Commission which are to:

- maximise funding for sport from the private sector, to supplement funds from the Commonwealth Budget;
- provide leadership in the development of Australia's performance in international sport;
- increase the level of participation in sport by all Australians.

It is the overriding aim of the Commission to make a significant contribution to the development of Australian sport at all levels as a flexible, innovative partner in the commu-

nity of sport. The Commission also provides a focus to achieve a greater degree of co-ordination within that community to ensure that available financial resources, expertise and experience are used to maximum effect.

The ASC is responsible for a range of specific functions, namely to:

- advise the Minister in relation to the promotion and development of sport;
- raise money through the Australian Sports Aid Foundation for the purposes of the Commission;
- administer and spend money from the Budget or raised by the Sports Aid Foundation for the purposes of the Commission;
- co-ordinate activities in Australia for the promotion and development of sport;
- consult and co-operate with appropriate authorities of the Commonwealth, of the States and of the Territories, and with other organisations, associations and persons, on matters related to its activities;
- initiate, encourage and facilitate research and development in relation to sport;
- collect and distribute information, and provide advice, on matters related to its activities.

### **Assistance to national sporting associations**

The ASC provides financial assistance to national sporting associations. This includes employing national executive directors and coaching directors, contributing to international competitions, administrative support and development projects.

### **Sports talent encouragement plan**

The scheme provides direct financial assistance to world-ranked Australian individual athletes and teams and to athletes demonstrating a capacity to achieve world rankings. The assistance contributes towards the costs of training and competition.

### **Applied Sports Research Program**

The Commission provides funds under the Applied Sports Research Program which enables national organisations to utilise tertiary institutions to carry out research related to their sport.

### **Children in sport**

Assistance is provided to national sporting bodies to assist junior sports development. In addition, the Commission has established the AUSSIE SPORTS program to improve the quality and variety of sport for primary school children.

### **Equity and access**

The Commission is also concerned to increase participation in sport among groups which have not had sufficient access to sporting opportunity.

### **Drugs in sport**

Funds have been provided to the National Program on Drugs in Sports Committee. This has enabled the employment of a full-time co-ordinator and the preparation of educational material. Drug testing programs are also being developed.

### **Australian Coaching Council**

The Commission funds the position of Australian Coaching Council Director responsible for the National Coaching Accreditation Scheme and for the development of resource materials. The position reports directly to the Coaching Council, which is funded by the Commission.

## **ENVIRONMENT AND CONSERVATION**

Protecting and regulating the environment are primary responsibilities of State and local governments. The Commonwealth Government has become involved in environmental policy and regulation through increased community awareness of the fragility of the environment on a national scale when subject to pressure of human activity. The Senate Standing

Committee Reports on Air and Water Pollution of the late 1960s were the first concerted attempt to place environmental policy on the Commonwealth legislative agenda.

The *Environmental Assessment (Impact of Proposals) Act 1974* was the first piece of Commonwealth legislation to address environmental issues. The act defined environment as comprising 'all aspects of the surroundings of human beings, whether affecting them as individuals or in social groupings', and set up procedures to review adverse impacts of development proposals which involved Commonwealth Government decisions.

Since then, the Government has intervened on a number of occasions where environmental values were attracting broad community attention, notably the mining of Fraser Island in Queensland and the damming of the Franklin River in South West Tasmania. Through these and other actions, the Commonwealth Government has been drawn into areas of environmental policy, planning and management not adequately covered by existing State administrative arrangements.

This national recognition of environmental values has been preceded by years of community action and debate. In April 1986, the Australian Bureau of Statistics conducted a survey of households throughout Australia to measure environmental awareness. Results from the survey show that people take an active interest in the environment.

The first half of this section sets out major findings from the 1986 survey; the second half covers areas of involvement by the Commonwealth and its agencies in environmental management, and the co-ordination of conservation and regulation activities undertaken at State, Territory and local levels.

### Awareness of environmental issues

In April 1986, 47 per cent of the population aged 15 years and over (5.5 million persons) was concerned about problems with the environment in Australia. The percentage was slightly higher for females than for males, and the percentage in the 25-44 years age group was significantly higher than other age groups. The problems that most concerned people were pollution (30 per cent), nature conservation (21 per cent) and deforestation (19 per cent).

#### PERSONS CONCERNED ABOUT THE ENVIRONMENT BY AGE GROUPS: TYPE OF ENVIRONMENTAL PROBLEM

| Type of environmental problem         | Age group (years)    |       |       |       |       |             | Total   |
|---------------------------------------|----------------------|-------|-------|-------|-------|-------------|---------|
|                                       | 15-24                | 25-34 | 35-44 | 45-54 | 55-64 | 65 and over |         |

(a) Respondents were allowed to register more than one concern. (b) Percentages are expressed as proportions of civilian population 15 years and over excluding those persons for which no answer was obtained.

### Pollution and other environmental complaints

442,000 persons, or about 4 per cent of the population aged 15 years and over, actually registered complaints about pollution in the twelve months to April 1986. 558,000 persons (5 per cent) registered complaints about other environmental problems.

(a) Percentages are expressed as proportions of civilian population 15 years and over excluding those persons for which no answer was obtained.

### Recycling

The survey found that 34 per cent of households in Australia actively recycle glass and bottles. Participation is highest in South Australia with 51 per cent of households involved. 1.6 million households (29 per cent of all households) recycle paper, with the Australian Capital Territory (44 per cent) and Victoria (42 per cent) having the highest participation rates. On the other hand only 19 per cent of households recycle aluminium and steel cans. South Australia, with 33 per cent of households involved, again showed highest participation among States and Territories.

## Usage of national parks

Most national parks have been so designated under State national park legislation. For the purpose of the April 1986 survey, national parks were those listed as such in the Australian National Parks and Wildlife Service (ANPWS) *Occasional Paper No. 10—Nature Conservation Reserves in Australia (1984)*.

National parks under Commonwealth jurisdiction comprise the three areas under the direct management of the ANPWS, a Commonwealth statutory authority, and Namadgi National Park within the Australian Capital Territory, managed by the A.C.T. Parks and Conservation Service. All other national parks are administered by parks services in the respective States and the Northern Territory.

(a) Excludes national parks which form part of World Heritage Areas.

## Commonwealth responsibility for environment and conservation

In Commonwealth legislation, environment includes all aspects of human surroundings, whether affecting individuals or social groupings. Thus the environmental responsibilities of the Government relate to a broad range of activities bearing on the protection, conservation and extension of environmental quality and amenity. These responsibilities are shared among many agencies of government although a special focus is provided by the Ministry of the Arts, Sport, the Environment, Tourism and Territories.

The Commonwealth is responsible for the environment of the Territories, for the environmental impacts of its agencies operating in the States, and for contributing to international environmental activities. The Commonwealth also plays a major role in the national co-ordination of environmental protection and conservation activities, and contributes substantively to environmental research, environmental education and information exchange.

## National activities

National collaboration on environmental matters is facilitated through Commonwealth and State Ministerial councils and other advisory bodies, and through a variety of nationally co-ordinated activities and programs.

### Australian Environment Council

The Australian Environment Council was established in 1972 by agreement between the Prime Minister and the State Premiers. The members of the Council are the Ministers responsible for environmental matters in each State, internal Territory and the Commonwealth Government. New Zealand and Papua New Guinea have observer status on the Council.

The Council provides a forum for consultation, co-operation and liaison on matters concerning environmental management and pollution control. These matters have included the control of emissions and noise from motor vehicles, the use and disposal of hazardous chemicals, noise control, water quality, air pollution, solid-waste management, the economics of pollution abatement policies and environmental impact assessment, coastal management, land use policy, biotechnology and climate changes induced by human activities.

### **Council of Nature Conservation Ministers**

The Council of Nature Conservation Ministers was established in 1974 by agreement between the Prime Minister and State Premiers. It comprises Ministers with nature conservation responsibilities in each State, internal Territory and the Commonwealth Government as well as the Commonwealth Minister responsible for the Commonwealth Scientific and Industrial Research Organisation. New Zealand and Papua New Guinea have observer status on the Council.

The Council provides a forum for consultation, co-operation and liaison on matters relating to the conservation and management of Australia's flora and fauna. Specific matters considered by the Council have included trafficking in native animals and plants, culling of populations of native species, protection of endangered and threatened plants and animals, the control of diseases affecting or likely to affect natural ecosystems in Australia, ranger training, management of national parks, and identification of wilderness areas.

### **Australian Ionising Radiation Advisory Council**

The Australian Ionising Radiation Advisory Council advises the government on matters such as fallout over Australia from nuclear weapons testing, health effects of exposure to ionising radiation, radioactive waste management, visits of nuclear powered warships, and licensing and regulation of nuclear activities.

### **National Conservation Strategy for Australia**

Following the international launching of the World Conservation Strategy in 1980, the Commonwealth Government, all States and the Northern Territory agreed to co-operate in developing a National Conservation Strategy for Australia which would aim to achieve 'sustainable development'—that is, harmony between development and conservation of Australia's living resources and supporting ecosystems. After wide consultation with the States, non-government conservation groups, industry and the community, consensus was obtained on a strategy at a national conference held in June 1983.

The Commonwealth Government endorsed the National Conservation Strategy for Australia in June 1984. The Northern Territory and most State Governments have also endorsed the Strategy. Victoria and Western Australia have prepared State Conservation Strategies. In various ways, all governments have undertaken nature conservation activities consistent with the aims of the National Conservation Strategy.

### **National Tree Program**

The National Tree Program aims to conserve and establish trees and associated vegetation for community and private benefit throughout Australia. The objectives of the program are to increase selectively rural tree cover, promote co-ordinated action by individuals, governments and the community generally to conserve, plant and regenerate trees, and to develop public awareness of the value of trees.

Links with the Community Employment Program enabled implementation of several major revegetation projects, particularly in rural areas. A national tree data base (TREDAT) has been established.

### **Rainforest conservation**

The Federal Government agreed to provide \$22.5 million over the two years to 1987-88 for a National Rainforest Conservation Program which will include, inter alia, studies of the tourism potential of certain rainforests and funding of interpretative and visitor facilities.

### **Australian Biological Resources Study**

The Australian Biological Resources Study (ABRS) was established in 1973 to stimulate taxonomic and ecological studies of Australian flora and fauna through the provision of grants for research and publication. ABRS responsibilities include provision of advice on

national taxonomic collections and establishment and maintenance of a national taxonomic data bank. Much of the work of the study is done in State museums, botanic gardens and herbaria which were established during the last century. CSIRO also carries out important research relating to flora and fauna.

Current major projects of ABRIS include preparation of a 60 volume *Flora of Australia*, a 10 volume *Fauna of Australia*, compilation of a 70 volume *Zoological Catalogue of Australia* and establishment of data base exchange systems for museums and herbaria for biogeographic and taxonomic information.

### **Environment research**

The Department undertakes studies into Australian environmental issues and produces annual reports on the state of the environment in Australia. The CSIRO, universities and State environment agencies also carry out studies which contribute to the development of policies for environment protection, conservation and management of natural resources.

### **Infoterra**

The Department of the Arts, Sport, the Environment, Tourism and Territories is the Australian national focal point for INFOTERRA. INFOTERRA is an international information network, developed by the United Nations Environment Programme, to assist organisations and individuals in locating the sources of environmental information. The Department is also the INFOTERRA regional service centre for South East Asia and the South Pacific. Its function is to assist countries within the region and to improve their environmental information capability and service.

### **Control of environmental contaminants**

Various programs are concerned with the control of environmental contaminants. Final plans are being made for a national chemicals notification and assessment scheme. The Environment Protection (Sea Dumping) Act controls dumping of wastes in marine waters. National capacity for monitoring air pollution is being strengthened through a national monitoring, data acquisition and archiving program being implemented in conjunction with the States. Other activities cover codes of practice for activities involving radioactive materials, waste management, monitoring of the marine environment, environmental noise and air pollution control strategies.

### **Voluntary conservation organisations**

The Commonwealth Government makes grants annually to voluntary conservation organisations to assist them in their environmental awareness and education campaigns.

## **Statutory authorities**

### **Australian National Parks and Wildlife Service—ANPWS**

ANPWS is the principal adviser to the Commonwealth Government on national parks and wildlife. It works in close co-operation with other Commonwealth authorities and relevant State and Territory agencies. Responsibilities include nature conservation, wildlife management, national park planning and management, protection of cetaceans, creation of public awareness and involvement in conservation, preservation of the Australian national heritage and co-operation with Aboriginals in protecting wildlife and natural features.

#### **Kakadu National Park—Northern Territory**

The Park was extended in June 1987 and now covers 17,552 square kilometres in the Alligator Rivers Region approximately 200 kilometres east of Darwin. Following extensive public participation in its preparation, a new management plan came into operation on 14 November 1987. Substantial achievements have been made in the management of the Park.

Control of the feral water buffalo population has led to dramatic improvement in the condition of floodplain and wetland areas with consequent benefits to wildlife. Visitor facilities and access have been greatly improved with the development of three major camping areas and several less-formal camping areas, the construction of sealed roads to key features, and installation of facilities for the protection and interpretation of the renowned art sites of Ubirr (Obiri) and Nourlangie Rock. Approximately 130,000 people visited the Park in 1986.

#### **Uluru (Ayers Rock-Mount Olga) National Park—Northern Territory**

The Park covers an area of 132,566 hectares and is located approximately 300 kilometres south-west of Alice Springs. Current administrative arrangements for the park are dealt with under Aboriginal heritage protection in this chapter. An estimated 169,000 persons visited the Park in 1986-87.

#### **Great Barrier Reef Marine Park Authority**

This Authority was established by the *Great Barrier Reef Marine Park Act 1975* which provides for the establishment, control, care and development of a marine park in the Great Barrier Reef Region. The Marine Park covers an area of 345,000 square kilometres representing 98.5 per cent of the region. Management of the Marine Park is a co-operative venture with Queensland Government agencies. The main strategy used in management of the Park is 'zoning'. Zoning plans separate potentially conflicting activities while allowing all reasonable uses and ensuring the long-term conservation of the Reef's ecosystem.

#### **Supervising Scientist for the Alligator River Region**

Special arrangements have been made for minimising the environmental impact of uranium developments in the Northern Territory. The Commonwealth has appointed a Supervising Scientist who has overall responsibility to ensure the protection and restoration of the environment of the Alligator Rivers Region from the effects of mining.

## **TRAVEL AND TOURISM**

**World Expo 88**  
Brisbane Australia ©  
April - October

### **Australia's World Expo—1988**

Australia's World Expo 88 is the first international exposition to be held in the southern hemisphere this century. The last was held in Melbourne in 1888 to mark the occasion of Australia's centenary.

The first exposition was held in 1851 in London and, thereafter, expos became an international tradition. Since 1851, 21 expositions have been held in cities all over the world, including Paris (1867), Philadelphia (1876), San Francisco (1915), Brussels (1958), Osaka (1970) and Vancouver (1986).

The International Bureau of Expositions (BIE) controls world expositions under a convention signed by 47 countries in Paris in 1928. Countries apply to the BIE for approval to hold expos, the BIE approves applications and lays down protocol for their conduct.

The benefits from hosting such expositions are substantial. With more than 30 countries

and 20 corporations taking part in Australia's Expo in Brisbane, significant international attention will be generated and exhibitors will be given the opportunity to demonstrate their capabilities and achievements on the theme—'Leisure in the Age of Technology'.

It is expected that Australia's Expo will stimulate up to \$1,000m in economic terms and create more than 14,000 jobs—5,200 directly and a further 8,800 in indirect employment.

The initial indication that 25 countries were to participate has been exceeded, and now more than 30 are involved, drawing an estimated 8 million visits (665,000 of these from overseas).

The participants include: Alaska, Australia, Canada, Cyprus, European Communities, Federal Republic of Germany, Fiji, France, Greece, Hawaii, Hungary, Indonesia, Italy, Japan, Kenya, Kobe City (Japan), Nepal, New Zealand, Papua New Guinea, People's Republic of China, Republic of Korea, Saitama Prefecture (Japan), San Marino, Seychelles, Solomon Islands, Switzerland, Thailand, Tonga, Union of Soviet Socialist Republics, United Kingdom, United States of America, Vanuatu and Western Samoa.

The 1988 World Exposition is held in Brisbane, the capital of Queensland, situated 400 kilometres south of the Tropic of Capricorn. The symbol of World Expo 88 is two boomerangs, back to back, forming an X, with one flowing out to form a P and an O, in the outline of XPO.

The Australian and Queensland Governments are co-hosts of the \$600 million exposition. Expo is scheduled to run daily for six months from 30 April 1988. The array of displays, amusements, entertainment and exhibits is expected to ensure an average daily attendance of 48,000.

### Overseas travel

Statistics about travellers to and from Australia are classified in the first instance by the actual or intended length of stay in Australia or abroad; this classification distinguishes between long-term and short-term movement.

Statistics of permanent and long-term movement are shown in Chapter 6, Demography.

Statistics of short-term arrivals and departures which are in the nature of travel statistics are given below.

**Short-term movement:** defined as comprising visitor arrivals and Australian resident departures where the intention of staying in Australia or abroad is for a period of less than twelve months, together with departures of visitors and returns of Australian residents who have stayed in Australia or abroad for less than twelve months.

Short-term movement excludes persons who arrive in and depart from Australia on the same ship's voyage or on the same flight (variously called 'direct transit' or 'through' passengers), or who change flights without leaving the airport's transit area; passengers on pleasure cruises commencing and finishing in Australia; and all crew. However, it includes persons who pass through the customs barrier and declare the purpose of their visit to Australia to be 'in transit'. Short-term visitors are more numerous than long-term visitors and have come to be regarded as 'tourists' by many users of the statistics.

#### SUMMARY OF SHORT-TERM TRAVELLER STATISTICS

|                   | <i>Overseas visitors</i>             |                                          | <i>Australian residents</i>              |                                      |
|-------------------|--------------------------------------|------------------------------------------|------------------------------------------|--------------------------------------|

| 1981-85 . . . . . | 998,600                              | 966,600                                  | 1,337,600                                | 1,306,000                            |
| Year—             |                                      |                                          |                                          |                                      |
| 1981 . . . . .    | 936,700                              | 900,400                                  | 1,217,300                                | 1,181,400                            |
| 1982 . . . . .    | 954,700                              | 921,500                                  | 1,286,900                                | 1,259,600                            |
| 1983 . . . . .    | 943,900                              | 928,900                                  | 1,253,000                                | 1,219,700                            |
| 1984 . . . . .    | 1,015,100                            | 985,800                                  | 1,418,600                                | 1,374,700                            |
| 1985 . . . . .    | 1,142,600                            | 1,096,500                                | 1,512,000                                | 1,494,700                            |
| 1986 . . . . .    | 1,429,400                            | 1,363,800                                | 1,539,600                                | 1,513,200                            |

In addition to the basic classification of travellers shown above, certain other characteristics are ascertained. These are: sex, age, marital status, country of citizenship, country of birth, intended or actual length of stay, purpose of journey, mode of transport, country of residence or where most time was or will be spent, country of embarkation or disembarkation, State of residence or where most time was or will be spent, and State of embarkation or disembarkation.

The categories shown in the previous table are cross-classified by various characteristics listed above and resulting statistics are shown in considerable detail in quarterly and annual publications. Certain unpublished information is available on request. Selected traveller statistics are shown in the following tables.

Short-term travel is subject to marked seasonal variation, December being the peak month for the arrival of overseas visitors and the departure of Australian residents.

**SHORT-TERM MOVEMENT: ARRIVALS AND DEPARTURES OF OVERSEAS VISITORS AND AUSTRALIAN RESIDENTS BY MONTH OF ARRIVAL OR DEPARTURE, AUSTRALIA, 1986**

(persons)

| Month                                   | Overseas visitors |                  | Australian residents |                  |

(a) Asterisk (\*) denotes that figures are subject to sampling variability too high for most practical purposes.

In 1986 the majority of Australian residents departing for short-term visits abroad intended to stay for under one month, with 48 per cent intending to stay for under 3 weeks. The majority of short-term visitor arrivals to Australia intended to stay under three weeks, with 46 per cent intending to stay under 2 weeks.

Statistics for Australian residents refer to their total time away from Australia; for overseas visitors they refer only to the Australian portions of their trips.

In the case of both Australian residents departing and overseas visitors arriving, the most common reason for visit was 'holiday', followed by 'visiting relatives' and 'business' as the second and third most common reasons.

(a) The difference between the sum of the components and the total comprises 'not definite, not stated, etc.' (b) Asia includes countries which are frequently regarded as 'Middle East' countries, for example Iraq, Lebanon, Syria, etc. This inclusion is based on United Nations' classification of world regions. (c) Comprises the German Democratic Republic and the Federal Republic of Germany. (d) Includes Republic of Ireland and Ireland, undefined.

### Survey of International Visitors—IVS

Surveys of the travel pattern and attitudes of international visitors to Australia have been conducted on behalf of the Australian Tourist Commission for a number of years (annually between 1983 and 1986). No survey was conducted for 1987 but it is expected to be reintroduced for 1988.

Details contained in the survey include the arrival statistics, profile, itinerary, trip satisfaction and expenditure of short-term visitors to Australia (defined as foreign residents staying in Australia for a period of less than twelve months).

## Domestic travel

Information about domestic travel patterns of residents within Australia in 1985-86 was collected in the Domestic Tourism Monitor, commissioned by the Australian Standing Committee on Tourism and Conducted by McNair Anderson. The survey results show that the main purposes of trips were holiday or pleasure (50%), visiting friends and relatives (26%), and conference, seminar, business (11%). The main mode of transport used was private vehicle (81%). The mean length of a trip by domestic tourists was 4.5 nights in 1985-86.

The following tables contain data obtained from the survey.

### SUMMARY OF PERSON TRIPS AND NIGHTS AWAY, 1985-86

## Tourism

As a country, Australia offers domestic and international travellers a wide variety of tourist attractions. Its temperate climate and natural features of tropical forests, mountain ranges, pastoral regions and beaches provide a sharp contrast to the isolated outback, desert regions and attractions of an historical nature. Its major cities offer cultural and recreational pursuits and modern accommodation and convention and meeting facilities.

Australia is seen increasingly as an exciting but safe tourist destination in an environment of economic, political and social stability among a warm, friendly and hospitable people.

## Economic and social importance

Tourism in Australia is now recognised as an industry and an area of government policy concern in its own right.

A Bureau of Industry Economics report (BIE 1984) revealed that tourism is of major significance to the Australian economy. It estimated that tourism accounts for 4.8 per cent of Australia's Gross Domestic Product (GDP) and is responsible for employing 5.2 per cent of the workforce (equivalent to the textiles, clothing, footwear and motor vehicle industries combined). In 1981-82, the gross expenditure by domestic and overseas travellers in Australia was estimated to total almost \$12,700 million. Estimates by the Department of the Arts, Sport, the Environment, Tourism and Territories put the 1986-87 total tourism expenditure at \$22,300 million, with the level of direct and indirect employment created by this expenditure being estimated at 405,000.

The tourism industry is likely to undergo further expansion in the future, because of factors which include increasing general levels of affluence, increasing leisure time arising from shorter working hours and early retirement, saturation of demand for consumer durables, and improvements in the quality of facilities and services available to travellers.

In the context of these developments, both the Commonwealth and State Governments have become increasingly aware of the importance of tourism as an instrument of government policy and their respective roles in this field have expanded accordingly. Governments have in particular recognised the potential of tourism to stimulate economic growth and generate employment opportunities.

## Allocation of tourism responsibilities within the public sector

In broad terms the Commonwealth Government is responsible for international aspects of tourism development and the formulation and implementation of relevant national policies.

The State and Territory governments, in conjunction with local government, bear responsibility for the provision of public infrastructure and facilities and other more specific, localised services and regulations. Other responsibilities with broad implications or significance are shared between Federal, State and Territory Governments.

## Commonwealth activity

The Department of the Arts, Sport, the Environment, Tourism and Territories has been involved in a range of policy, administrative and consultative activities designed to encourage the efficient development of tourism in Australia in co-operation with the industry and with Commonwealth and State/Territory Government departments.

Major functions of the Department include:

- formulating proposals, transmitting advice to the Minister on industry issues, administering the Australian Tourist Commission Act, conducting research into the tourism and travel industries, providing secretarial support to a number of consultative councils and committees, and providing liaison with international tourism organisations.

Specific mechanisms exist to achieve these objectives through consultation and liaison.

These include the following:

- The *Tourist Ministers' Council* (TMC), which was established in 1959 and comprises the Commonwealth, State and Territory Ministers responsible for tourism.
- The *Australian Standing Committee on Tourism* (ASCOT), which comprises representation from the Department, the Australian Tourist Commission and the State and Territory Directors of Tourism or their equivalent.
- The *Tourism Research Committee* (TRC), which undertakes research as directed by ASCOT, comprises research officers from the Department, the Australian Tourist Commission and the State and Territory authorities responsible for tourism.
- The *Tourism Advisory Council* (TAC), which is chaired by the Minister for the Arts, Sport, the Environment, Tourism and Territories and includes senior representatives from the tourism industry and trade unions; and
- The *National Tourism Industry Training Committee* (NTITC), a tripartite body of representatives from industry, union and government, concerned with promoting, developing and co-ordinating training in tourism.

The Department is also responsible for Australia's bilateral and multilateral tourism

relations and contributes to the development of international tourism through Australia's membership of the following:

- The *World Tourism Organization (WTO)*, an agency of the *United Nations Development Program (UNDP)*, which examines all sectors of tourism on a world-wide basis. Australia has been a full member of the WTO since September 1979 and is currently chairing WTO's Regional Commission for East Asia and the Pacific (CAP).
- The *Tourism Committee of the Organisation for Economic Co-operation and Development (OECD)*. The Committee promotes co-operation between member countries in the field of tourism through examining issues such as transportation, energy, accommodation, employment, investment and profitability in the light of changing economic conditions.
- The *Economic and Social Commission for Asia and the Pacific (ESCAP)*, a regional commission of the UN Economic and Social Council concerned with economic and social development (including tourism development) in member countries.

### **Australian Tourist Commission**

The Australian Tourist Commission was established in 1967. It is a statutory authority and has the role of encouraging visits to Australia by people from other countries. The Commission was subject to a wide-ranging review in 1986 and was restructured in 1987. It now uses the trading name Tourism Australia. It had a staff of 90 worldwide and a budget allocation of \$29 million in 1986-87.

The Commission engages in a wide variety of marketing activities including consumer and trade advertising, industry seminars and familiarisation visits for travel agents, journalists and photographers. Funding increases in recent years have enabled it to expand its worldwide activities and, in particular, to undertake a major enhanced awareness campaign in the United States. A domestic tourism campaign aimed at encouraging Australians to see more of their own country was commenced in 1984.

The Commission has its head office in Sydney and overseas offices in Auckland, London, Frankfurt, New York, Los Angeles, Tokyo, Singapore, Toronto, Chicago, Milan, Osaka and Hong Kong.

### **Tourism industry**

The tourism industry incorporates a wide range of activities. These include, principally, the travel, accommodation, catering, hospitality, retail, and meetings and conventions as well as many other sectors of industry. The industry has been identified as a growth area, offering attractive opportunities for investment in tourism development projects and as a major employer of labour.

Tourism has a higher than average labour intensity and has considerable potential for providing employment for certain groups (such as unskilled and semi-skilled workers) who are otherwise vulnerable to unemployment. There are also opportunities for the employment of other groups such as women and part-time workers who cannot, or prefer not to, work conventional working hours.

As a way of heightening awareness of the Australian tourism product and to encourage excellence in the industry, an annual series of National Tourism Awards was inaugurated in September 1984.

### **Tourism Overseas Promotion Scheme—TOPS**

The Tourism Overseas Promotion Scheme (TOPS), which was announced on 19 June 1985, provides for the payment of taxable grants to Australian tourism operators to encourage them to attract increasing numbers of overseas tourists to Australia. The grant rate under TOPS is 70 cents in the dollar of eligible expenditure incurred in approved promotional activities.

The Scheme is funded by the Commonwealth Government and provides assistance to the tourism industry to replace the tourism provisions formerly incorporated in the Export Market Development Grants Scheme.

### **Consumer protection**

Overseas and domestic tourists are now being given greater consumer protection when dealing with travel agents following the introduction by several State and Territory govern-

ments of a licensing system for all travel agents, and the establishment of a National Compensation Fund. Under these arrangements compensation is available to consumers in participating States and Territories through the Fund, which has been established with contributions from travel agents. Licensing criteria cover financial performance, minimum experience/qualifications for managers and defined standards for premises.

## Tourist accommodation

### Services industries surveys

Data relating to accommodation enterprises are being collected as part of the 1986-87 surveys. Results will be published towards the end of 1988.

### Surveys of tourist accommodation establishments

Quarterly accommodation surveys were commenced in the September Quarter 1975 and data published from these surveys include room occupancy and takings from accommodation.

The main purpose of the surveys of tourist accommodation establishments is to measure the utilisation of available tourist accommodation. For detailed statistics from the survey see *Tourist Accommodation, Australia* (8635.0).

(a) For the purposes of this survey, a tourist accommodation establishment is defined as an establishment which predominantly provides short term accommodation (i.e. for periods of less than two months) available to the general public. (b) For definitions see *Tourist Accommodation, Australia* (8635.0).

The 1985-86 Domestic Tourism Monitor indicated that the main types of accommodation used were homes of friends or relatives (46%), hotels or motels (16%) and caravan parks or camping grounds (16%). The following table classifies the main type of accommodation used by the main purpose of the trip.

**NUMBER OF PERSON TRIPS BY MAIN  
TYPE OF ACCOMMODATION AND MAIN PURPOSE OF TRIP, 1985-86**  
(*'000 person trips*)

### Major tourism projects

Based on information provided by the State/Territory tourism authorities, the Department of the Arts, Sport, the Environment, Tourism and Territories has estimated that, at the end of June 1987, there were some \$3,564 million of major tourism projects under construction and another \$5,441 million of projects firmly committed to commence construction within eighteen months thereafter.

Commencements of tourist accommodation and resorts in the 1986-87 financial year were valued at \$799 million and it is estimated these projects will provide about 17,565 man-years of employment during construction and, when operational, require employment of around 4,220 permanent full and part-time staff.

### Vocational training

1986 saw greater priority being given to the issue of training within the tourism and hospitality industry. The Federal Government established a committee to discuss ways of implementing the recommendations made by the Tourism Training Review Group in its 1985 report on tourism training in Australia. The committee has provided a strategic framework for training in all sectors of the tourism industry and detailed immediate and longer-term needs and action required to meet them.

### Steel regions assistance

In 1986-87, \$2 million was allocated to support the growth of tourism in the economically depressed Hunter and Illawarra steel regions of New South Wales. This is part of an on-going program for federally funded infrastructure projects in these regions which will provide up to \$18 million to 1987-88 for tourism projects.

### Foreign investment

During 1986-87 there was a substantial relaxation of foreign investment guidelines making it easier for foreigners to invest in Australia. As a general rule, while proposals for foreign investment in tourism ventures still need to be notified to the Foreign Investment Review Board, they are now approved unless they are contrary to the national interest. The previous requirement for 50 per cent Australian equity has been removed. This change has stimulated significantly increased activity in overseas investment in the tourism industry, particularly from Japan.

# AUSTRALIA'S NATIONAL ESTATE

*(This special article has been contributed by the Australian Heritage Commission)*

## **Australians' concern for their environment**

In August 1974 the Government-appointed Committee of Inquiry into the National Estate reported to Federal Parliament that uncontrolled development, economic growth and 'progress' to that time had had a very detrimental effect on Australia's national estate. Its report called for prompt action and public education to prevent further neglect and destruction. The Committee's report was a synthesis of a broad collection of the views and attitudes of Australian citizens towards their environment.

The inquiry received more than 650 submissions—from all levels of government, national trusts and nature conservation organisations, professional associations, trade unions and individuals. Members of the Committee travelled around Australia following up points raised in submissions, holding public meetings and talking to people.

One interesting finding of the inquiry was that Australians across a wide socio-economic range expressed concern for the environment. Conservation emerged as an important issue. To quote a paragraph from the report:

The Conservation of the National Estate is the concern of everyone. The forces which threaten it directly affect the quality of life of the less privileged urban people, whose access to and enjoyment of parkland, coast and natural bushland, of familiar and pleasant urban city-scapes, and sometimes their own dwellings, are endangered. Often it is these less privileged who are initiating and supporting action to preserve the best features of our present way of life . . .

## **Australian Heritage Commission**

On a recommendation of the Committee of Inquiry, the Australian Heritage Commission was established. Its enabling legislation was passed in July 1975 with the support of all political parties.

The Commission's role is to advise the Federal Government on the protection of the national estate. In summary, its responsibilities are to:

- prepare and maintain a register of national estate places;
- advise the Minister of the Arts, Sport, the Environment, Tourism and Territories on all matters relating to the national estate;
- develop policies and programs for research, professional training and public education.

## **Protecting the national estate**

The major work of the Australian Heritage Commission has been the development of the Register of the National Estate.

The term 'national estate', coined by the Welsh architect William Clough Ellis in the 1940s and later used by U.S. President John Kennedy, is a very broad-ranging concept. In the legislation, the national estate is defined as:

. . . those places, being components of the natural environment of Australia, or the cultural environment of Australia, that have aesthetic, historic, scientific or social significance or other special value for future generations as well as for the present generation.

It thus consists of all those places which have been identified as worth keeping and handing on to future generations. Such places include wildlife habitats, natural ecosystems, landscapes of great beauty, grand buildings and structures, humble dwellings, work places, ruins, sites of historic events and Aboriginal places such as dreaming tracks, rock art sites, ceremonial and archaeological sites. Portable objects, such as paintings and works of art are not included.

Protecting the national estate requires a partnership of government at all levels—Commonwealth, State and local. It also requires the involvement of the voluntary conservation organisations, community groups, educational institutions and individuals.

### Places in the Register of the National Estate

In June 1986 there were 7,974 places listed in the Register of the National Estate and another 281 on the interim list. The largest proportion of these places are historic buildings although some of the places listed for their natural significance, for example, national parks, may cover very large areas and may have historic or Aboriginal sites within them. The table shows the current distribution of national estate listed places across Australia.

THE REGISTER OF THE NATIONAL ESTATE  
AT 30 JUNE 1986

| State                |              | Built        | Aboriginal | Natural      | Total        |

| <b>Grand total</b>   |              | <b>6,325</b> | <b>560</b> | <b>1,370</b> | <b>8,255</b> |

(a) Reg. = Registered (includes all places in this status group)

(b) IL = Interim List (includes all places in this status group)

Most of these listed places fall into one or several of the following categories:

*In the natural environment:* national parks, nature reserves and other places for the protection of native fauna and flora; the coastline and islands; inland water expanses, rivers, lakes and other wetlands; special landforms, geological features, caves, forests, woodlands, grasslands; areas of scientific interest.

*In the cultural environment:* Aboriginal rock art sites, ceremonial grounds and sacred sites; Aboriginal quarries and shell mounds, campsites and fishtraps; important historical and archaeological sites (both Aboriginal and European); historic buildings and structures, either individual or in groups; historic towns and precincts.

The better known and more widely accepted National Estate places, like the Great Barrier Reef, Uluru (Ayers Rock), Kosciuszko National Park, the Sydney Harbour Bridge, the Sydney Opera House, the Australian War Memorial, the historic Tasmanian town of Richmond, the cathedrals of Adelaide and the historic port of Fremantle, are found in the national inventory alongside smaller scale and more humble places, like memorial drinking fountains, graveyards and cemeteries, ruins, railway bridges and even historic or Aboriginal carved trees.

There are no gradings between different categories of places and all registrations have the same status.

The Register of the National Estate is an open-ended inventory. New places can be added to it as they are assessed as having National Estate value. Places can be taken off it if for some reason they lose their value, for example, historic buildings after major modification.

The function of the Register of the National Estate is to provide the basis for the development of programs to identify, protect and enhance the National Estate. It also provides a focus and direction for funding under the Federal Government's National Estate Grants Program. Approximately \$30 million has been allocated since the program was set up.

Although most of the places that would be expected to be found on the Register are now included, the Commission is still receiving a large number of nominations each year.

### **The effects of listing**

Under the *Australian Heritage Commission Act 1975*, registration imposes some constraints on the actions of Commonwealth Ministers and authorities. Section 30 of the Act provides that Commonwealth Ministers and agencies must not take any action which would adversely affect any places in the Register unless there is no feasible and prudent alternative, or unless all action is taken to minimise damage where there is no such alternative.

The Commission has no power over the actions of State or local governments, or private owners that may affect a place in the Register of the National Estate.

### **Public education and training for conservation**

The Commission has a statutory obligation to heighten awareness of the value of the National Estate, and of issues affecting it.

It is implementing a comprehensive information/education program which includes a wide range of publications, the use of films and television, displays and exhibitions, the running of seminars and workshops to enhance understanding about the National Estate.

The Commission has established contact with voluntary conservation movements and government agencies that have the potential to publicise the national estate, for example, Australia Post, Promotion Australia and the Australian Broadcasting Commission. It also has instigated a number of heritage projects with commercial enterprise.

### **The World Heritage Convention**

In August 1974, Australia became one of the first countries to ratify the International Convention for the Protection of the World Cultural and National Heritage (The World Heritage Convention). This Convention was adopted by the General Assembly of UNESCO in 1972 and came into force in 1975. It has now been signed by more than eighty countries.

The Convention aims to ensure international co-operation for the safeguarding of the globe's irreplaceable heritage. This co-operation is vital in a world with population and energy pressures, technological change and industrialisation, and changing boundaries and economic circumstances.

The World Heritage Convention requires State Parties (i.e. countries who are signatories to the Convention) to adopt general policies, to establish appropriate organisations and services and to develop suitable legal, technical, scientific and financial measures for the protection, conservation and the preservation of their natural and cultural heritage.

State Parties are also required to submit an inventory of property suitable for the World Heritage List. This list is being compiled to ensure that places of 'outstanding universal value' are recognised and protected.

### **Australia's World Heritage properties**

Six Australian places have been assessed by the World Heritage Committee as being of 'outstanding universal value' and are now inscribed on the UNESCO World Heritage List.

They are the Great Barrier Reef, the Lord Howe Island Group, Kakadu National Park, the Willandra Lakes Region, the Western Tasmania Wilderness National Parks and the Australian East Coast Temperate and Sub-tropical Rainforest Parks.

These properties now take their place on a list including such places as the Pyramid Fields of Egypt, the Historic Centre of Rome, the Palace and Park of Versailles, Kathmandu Valley, Grand Canyon National Park and the Rock-hewn Church of Ivanovo. Only six of the places have been inscribed for both their cultural and natural significance, three of which are Australian (Kakadu, Willandra and South West Tasmania).

**The Great Barrier Reef**, a maze of reefs and islands stretching 2,000 kilometres along the Queensland coast and covering some 35 million hectares, is the largest coral reef system in the world and the richest in biological diversity.

**The Lord Howe Island Group** includes Lord Howe Island, the spectacular Ball's Pyramid, adjacent islets to the south and the Admiralty Islands to the north, and the coral reefs of the area. Its value derives from its unique landform and its diverse and largely intact ecosystems.

**The Willandra Lakes Region**, covering some 6,000 square kilometres in far western New South Wales, provides outstanding evidence of the antiquity of modern man, of the life and culture of early Aboriginal societies, and an unrivalled record of past environments and landscapes.

**Kakadu National Park** is of universal significance for its landform, its variety of flora and fauna and its rich legacy of Aboriginal art and occupation sites. The Park is located in the Alligator Rivers Region of Arnhem Land in the Northern Territory and contains extensive wetlands.

**The Western Tasmanian Wilderness National Parks** cover 770,000 hectares of one of the last great temperate wilderness areas in the world. Archaeological excavations in the area have uncovered evidence that shows humans were occupying the area 20,000 years ago, at the height of the last glaciation.

**The Australia East Coast Temperate and Sub-tropical Rainforests Parks** are rainforest areas in coastal New South Wales. They include two types of cool temperate rainforest, a major part of Australia's warm temperate rainforest and a sample of sub-tropical rainforest types. The areas show the evolutionary history of rainforest in this part of the world and also provide the habitats for populations of many rare and endangered species.

## CHAPTER THIRTEEN

### AGRICULTURAL INDUSTRIES

---

This chapter is divided into the following major parts:—Introduction; Sources of statistics and definitions of units; Structural statistics (provides data on the legal arrangements, size and industry class of the business organisations operating within the agricultural sector); Value of agricultural commodities produced and index of values at constant prices; Apparent consumption of foodstuffs and nutrients; Land tenure and utilisation; Crop statistics; Livestock statistics; Livestock products; Agricultural improvements, employment, regulation of agricultural industries, and the agricultural research activities of the Commonwealth Scientific and Industrial Research Organisation (CSIRO).

A special article, contributed by the Division of Water Resources Research, CSIRO, is included at the end of the chapter.

#### Introduction

The development of Australian agricultural industries has been determined by interacting factors such as profitable markets, the opening up of new land (including the development of transport facilities) and technical and scientific achievements. Subsistence farming, recurring gluts, low prices and losses to farmers were gradually overcome by the development of an export trade. Profitable overseas markets for merino wool and wheat, and the introduction of storage and refrigerated shipping for the dairying and meat industry, combined to make the agricultural sector Australia's main export earner. Until the late 1950s, agricultural products comprised more than 80 per cent of the value of Australia's exports. Since then, the proportion of Australia's exports from the agricultural sector has declined markedly.

However, this decline in importance has been due not to a decline in agricultural activity but rather to an increase in the quantity and values of the exports of the mining and manufacturing sectors. In fact, the agricultural sector experienced an increase in total output over that period. One interesting aspect of this increase in output is that it was accompanied by a large reduction in the size of the agricultural labour force, implying a large growth in productivity within the sector.

#### Sources of statistics and definitions of units

The major source of the statistics in this chapter is the Agricultural Census conducted at 31 March each year. A wide range of information is collected from agricultural establishments with agricultural activity covering the physical aspects of agriculture such as area and production of crops, fertilisers used, number of livestock disposed of, etc. In conjunction with the Census, certain supplementary collections are conducted in some States where this has proved expedient, e.g. where the harvesting of certain crops has not been completed by 31 March (apples, potatoes, etc.), special returns covering the crops concerned are collected after the completion of the harvest.

The ABS excludes from the Census those establishments which make only a small contribution to overall agricultural production. Thus the 1985–86 Census includes establishments with agricultural activity which had, or were expected to have, an estimated value of agricultural operations of \$2,500 or more. In previous years, the value cut off was applied at the enterprise level—for 1981–82 the value was \$2,500 and for earlier years, \$1,500.

While these changes have resulted in some changes in the counts of numbers of establishments appearing in publications, the effect on the statistics of production of major commodities is small. Statistics of minor commodities normally associated with small scale operations may be affected to a greater extent.

Details of the method used in the calculation of the estimated value of agricultural operations are contained in the publication *Agricultural Industries: Structure of Operating Units, Australia* (7102.0).

### Integrated Register Information System—IRIS

Details of agricultural units for 1985-86 have been derived from IRIS. Details of the structure of economic units engaged in agriculture, in hierarchical order, are:

- **Enterprise** (the second level of economic unit). The enterprise is that unit comprising all operations in Australia of a single operating legal entity. (The term 'single legal entity' means a sole trader, partnership, company, trust, co-operative or estate in the private sector, or a department, local government authority or statutory authority in the government sector). For the agricultural sector, a 'multi-State enterprise' is an enterprise which belongs to an enterprise group which undertakes agricultural activities in more than one State.
- **Establishment** (the smallest economic unit). The establishment covers all operations carried out by one enterprise at a single physical location.

### Other statistical collections

The ABS conducts a number of other collections to obtain agricultural statistics. These include collections from wool brokers and dealers, livestock slaughterers and other organisations involved in the marketing and selling of agricultural commodities.

For financial statistics from the Agricultural Finance Survey, last conducted for 1980-81, see *Year Book* No. 69, page 250, or *Agricultural Industries: Financial Statistics, Australia, 1980-81* (7507.0).

### Structural statistics

The following tables provide information relating to the structure of operating units during 1984-85. Although the definitions of the operating units have been provided above, the following terminology is also used:

- **Industry**. As set out in the *Australian Standard Industrial Classification (ASIC)* (1201.0 and 1202.0). These publications provide details of the methodology used in determining the industry class of an economic unit.
- **Estimated Value of Agricultural Operations (EVAO)**. This is determined by valuing the physical crop and livestock information collected in the Agricultural Census.

A further explanation of this terminology and more detailed statistics are given in the publication *Agricultural Industries: Structure of Operating Units, Australia* (7102.0).

#### NUMBER OF UNITS BY TYPE OF UNIT

| Year/unit                                                                    | N.S.W. | Vic.   | Qld    | S.A.   | W.A.   | Tas.  | N.T. | A.C.T. | Aust.      |
|------------------------------------------------------------------------------|--------|--------|--------|--------|--------|-------|------|--------|------------|
| 1982-83—                                                                     |        |        |        |        |        |       |      |        |            |
| Agricultural establishments . . . . .                                        | 52,952 | 46,661 | 33,764 | 19,840 | 16,471 | 5,702 | 238  | 103    | 175,731    |
| Establishments with agricultural activity . . . . .                          | 53,705 | 47,167 | 34,036 | 20,119 | 16,809 | 5,840 | 246  | 103    | 178,025    |
| Agricultural enterprises . . . . .                                           |        |        |        |        | —n.a.— |       |      |        |            |
| Non-agricultural enterprises operating agricultural establishments . . . . . |        |        |        |        | —n.a.— |       |      |        |            |
| 1983-84—                                                                     |        |        |        |        |        |       |      |        |            |
| Agricultural establishments . . . . .                                        | 52,704 | 45,560 | 33,948 | 19,289 | 16,584 | 5,586 | 253  | 101    | 174,025    |
| Establishments with agricultural activity . . . . .                          | 53,011 | 45,984 | 34,167 | 19,479 | 16,750 | 5,664 | 255  | 102    | 175,412    |
| Agricultural enterprises . . . . .                                           |        |        |        |        | —n.a.— |       |      |        |            |
| Non-agricultural enterprises operating agricultural establishments . . . . . |        |        |        |        | —n.a.— |       |      |        |            |
| 1984-85—                                                                     |        |        |        |        |        |       |      |        |            |
| Agricultural establishments . . . . .                                        | 51,786 | 45,032 | 33,614 | 18,915 | 16,341 | 5,384 | 265  | 104    | 171,441    |
| Establishments with agricultural activity . . . . .                          | 52,116 | 45,452 | 33,836 | 19,191 | 16,626 | 5,470 | 265  | 105    | 173,061    |
| Agricultural enterprises . . . . .                                           | 50,209 | 44,000 | 32,271 | 18,439 | 15,177 | 5,211 | 234  | 85     | (a)165,970 |
| Non-agricultural enterprises operating agricultural establishments . . . . . | 584    | 462    | 343    | 153    | 283    | 114   | 3    | 2      | (a)2,088   |

(a) Includes 'Multi-state' enterprises, i.e. enterprises which operated establishments in more than one State or Territory.

**AGRICULTURAL ESTABLISHMENTS: INDUSTRY AND ESTIMATED VALUE OF AGRICULTURAL OPERATIONS: 1984-85**

(a) Includes establishments with an EVAO of less than \$3,000.

(b) Includes the Northern Territory and the Australian Capital Territory.

**Value of agricultural commodities produced and index of values at constant prices**

**Definitions**

**Gross value of commodities produced:** the value placed on recorded production at the wholesale prices realised in the market place.

**Marketing costs:** include freight, cost of containers, commission and other charges incurred in marketing.

**Local value of commodities produced:** the value placed on commodities at the place of production and is ascertained by deducting marketing costs from the gross value.

**Index of values at constant prices:** the index of the gross value of commodities produced at constant prices, i.e. it is a measure of change in value after the direct effects of price changes have been eliminated.

## VALUES OF AGRICULTURAL COMMODITIES, 1985-86

(a) Weighted by average unit values for the year 1979-80.

## Publications

Two preliminary estimates of value of commodities produced are published: *Value of Principal Agricultural Commodities Produced, Australia, Preliminary (7501.0)* and *Value of Selected Agricultural Commodities Produced, Australia, Preliminary (7502.0)*. A final publication, *Value of Agricultural Commodities Produced, Australia (7503.0)*, contains Indexes of Values at Constant Prices.

## Index of Agricultural Commodities Produced

The index is consistent in scope with those of previous years. The indexes are weighted by the average unit values for the year 1979-80 with a reference base of 1979-80=1000.

For further details on how these and earlier series were calculated see *Year Book No. 61*, and *Value of Agricultural Commodities Produced, Australia (7503.0)*.

(a) Indexes of values at constant prices (weighted by average unit values of the year 1979-80). (b) Sugar cane cut for crushing and planting. (c) Includes pastures and grasses. Excludes crops for green feed or silage. (d) Includes dairy cattle slaughtered. (e) Component series based on carcass weight. (f) Includes honey and beeswax.

### Apparent consumption of foodstuffs and nutrients

Estimates of consumption in Australia are compiled by deducting net exports from the sum of production and imports and allowing for recorded movement in stocks of the respective commodities. The term 'consumption' is used in a specialised sense, since the quantities actually measured are broadly the quantities available for consumption at a particular level of distribution, i.e. ex-market, ex-store or ex-factory depending on the method of marketing and/or processing. Because consumption of foodstuffs is measured, in general, at 'producer' level no allowance is made for wastage before they are consumed. The effect of ignoring wastage is ultimately to overstate consumption but it is believed that more efficient distribution and storage methods in recent years have cut down wastage. Furthermore, it is likely that many of the foodstuffs are being supplemented by householders' self-supplies over and above the broad estimate already made.

The estimates of consumption per capita have been obtained by using the mean resident population for the period.

More detailed information on the consumption of foodstuffs is contained in the publication *Apparent Consumption of Foodstuffs and Nutrients, Australia* (4306.0). For some commodities, more timely information is contained in the publication *Apparent Consumption of Selected Foodstuffs, Australia (Preliminary)* (4315.0).

(a) Includes bacon and ham. (b) Includes flour used for breadmaking. (c) Data from 1982-83 consists of commercial disposals only. (d) Includes an estimate for vegetable oils and other fats. (e) Includes sugar content of syrups and glucose. (f) Coffee and coffee products in terms of roasted coffee.

**Nutrients**

The nutrients table has been compiled by the Nutrition Section of the Commonwealth Department of Community Services and Health and is based on the estimates of the quantity of foodstuffs available for per capita consumption.

For further information on the level of nutrient intake see the publication *Apparent Consumption of Foodstuffs and Nutrients, Australia* (4306.0).

**ESTIMATED SUPPLY OF NUTRIENTS AVAILABLE FOR CONSUMPTION (a)**  
(per capita per day)

(a) Figures are based on conversion factors calculated from the revised and enlarged edition of S. Thomas and M. Corden *Metric Tables of Composition of Australian Foods*, Canberra, 1977. (b) Data show adjustments made for loss of nutrients in cooking and the extra niacin obtained from the metabolism of protein.

## Land tenures

Land tenure statistics mainly relate to land held under freehold tenure ('alienated or in process of alienation') or leasehold tenure ('leased or licenced') with all agricultural establishments falling within these categories. Descriptions of the land tenure systems of the States and the Territories, and conspectuses of land legislation in force were provided in *Year Book* No. 48 and *Year Book* No. 50.

### Disposal of Crown lands

For a description of the provisions that exist in all mainland States for the disposal of Crown lands for public purposes, for unconditional purchase and occupation under lease or licence, see *Year Book* No. 61.

### Closer settlement and war service settlement

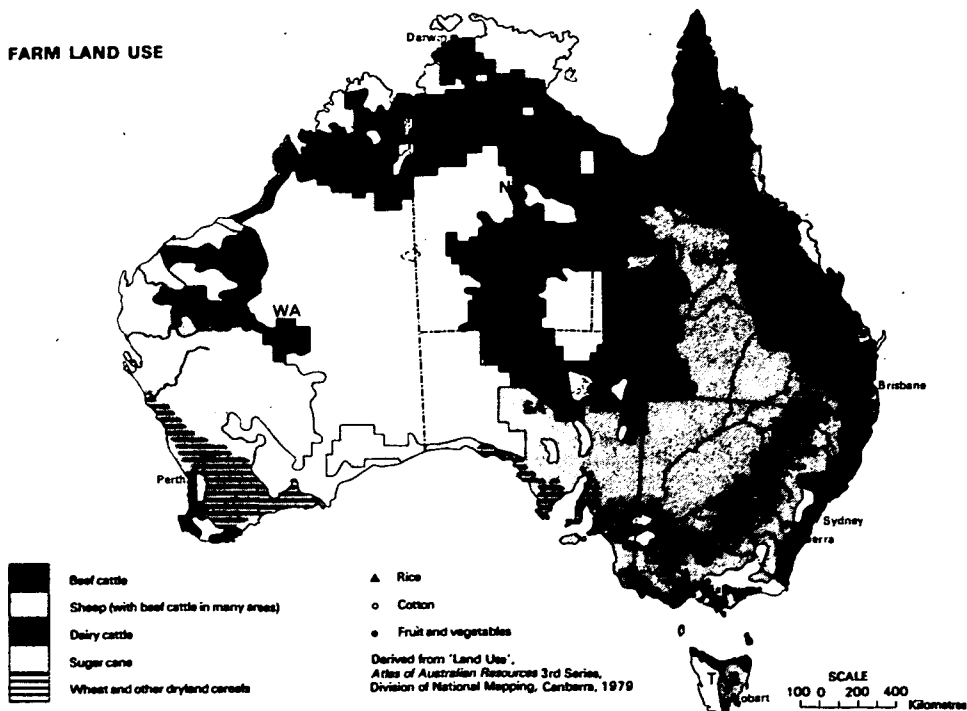

Particulars of these are given in issues of the *Year Book* up to No. 22, and in *Year Book* Nos. 48, 55 and 61.

### Alienation and occupation of Crown lands

For data relating to land tenures in the States and Territories, see *Year Book* No. 66 and *Year Book* No. 67.

## Land utilisation in Australia

The total area under tenure differs from the total area of agricultural establishments (shown in the following table) by amounts which represent unused land or land held for non-agricultural purposes. In general, land in the more fertile regions tends to be mostly freehold, while the less productive land is held under Crown lease or licence.

**AREA OF ESTABLISHMENTS WITH AGRICULTURAL ACTIVITY**

(a) Excludes pastures and grasses harvested for hay and seed which have been included in 'sown pastures and grasses'. (b) Prior to 1981-82 figures related to area 'used for' crop or pasture, i.e., an area used for more than one purpose during the year was counted only once. From 1981-82, an area double cropped or an area of pasture also planted to crop has been counted separately each time used. (c) Used for grazing, lying idle, fallow, etc.

The total area of agricultural establishments in 1985-86 constituted 63.2 per cent of the Australian land area, the remainder being urban areas, State forests and mining leases, with an overwhelming proportion of unoccupied land (mainly desert). The balance data include large areas of arid or rugged land held under grazing licences but not always used for grazing. Balance data also include variable amounts of fallow land.

The crop area data represent up to 4.3 per cent of the area of agricultural establishments and emphasise the relative importance of the livestock industry in Australia. (see page 501)

## Crops

For this section, statistics relating to crop areas and production have been obtained from the annual Agricultural Census. The Census returns are collected in all States and the two Territories at 31 March each year and relate mainly to crops sown in the previous twelve months.

Where harvests are not completed by March (e.g. potatoes), provision is made in some States for a supplementary collection after the harvest is completed. Additional statistics relating to value of agricultural commodities produced, manufactured production and overseas trade are also included. Agricultural Census data published in this section refer to the 'agricultural' year ended 31 March, while other data refer to the year ended 30 June; but for most purposes there will be little error involved in considering 'agricultural year' data as applying to the financial year.

The following table shows the area of crops in each of the States and Territories of Australia since 1860-61.

AREA OF CROPS (a)  
(<sup>'000</sup> hectares)

| Year              | N.S.W. | Vic.  | Qld   | S.A.  | W.A.  | Tas | N.T. | A.C.T. | Aust.  |

| 1985-86 . . . . . | 5,990  | 2,528 | 3,231 | 3,039 | 5,970 | 88  | 7    | 1      | 20,853 |

(a) The classification of crops was revised in 1971-72 and adjustments made to statistics back to 1967-68. After 1966-67 lucerne for green feed, hay and seed, and pasture cut for hay and harvested for seed or green feed are excluded.

NOTE: From 1970-71 to 1980-81 figures related to area 'used for' crops, ie, an area used for more than one purpose during the year was counted only once. From 1981-82, an area double cropped has been counted separately each time used.

The wide range of climatic and soil conditions over the agricultural regions of Australia has resulted in a diversity of crops being grown throughout the country. Generally, cereal crops (excluding rice, maize and sorghum) are grown in all mainland States over wide areas, while other crops are confined to specific locations in a few States. However, scanty or erratic rainfall, limited potential for irrigation and unsuitable soils or topography have restricted intensive agriculture. Despite this, agricultural production has increased over time to meet increased demands both in Australia and from overseas.

The following table provides an Australian summary of the area, production and gross value of the principal crops.

**CROPS: AREA, PRODUCTION AND GROSS VALUE**

|                                                        | 1983-84           |                                     |                         | 1984-85           |                                     |                         | 1985-86           |                                     |                         |

In the tables that follow, crop statistics are shown in these groupings: wheat, coarse grains, rice, oilseeds, sugar, vegetables, fruit, grapes and other crops such as tobacco, mushrooms and fodder crops.

## Cereal grains

In Australia, cereals are conveniently divided into autumn-winter-spring growing ('winter' cereals) and spring-summer-autumn growing ('summer' cereals). Winter cereals such as wheat, oats, barley and rye are usually grown in rotation with some form of pasture such as grass, subterranean clover, medics or lucerne. In recent years, alternative winter crops such as rapeseed, field peas and lupins have been introduced to cereal rotation in areas where they had not previously been grown. Rice, maize, sorghum and the millets are summer cereals with the latter two being grown in association with winter cereals in some areas. In Northern Queensland and Western Australia there are two rice growing seasons—a dry season winter crop and a wet season summer crop.

Cereals for grain form a significant percentage of both the value of Australia's agricultural commodities and of the country's export earnings. The following table shows the significance of cereal grains in the last 6 years.

(a) Principally wheat, barley, oats, grain sorghum, rice and maize, with panicum/millet, canary seed and rye being minor cereals.

### Wheat

Wheat is grown in all States, and is Australia's most important crop in terms of production and exports. As 70 to 80 per cent of the wheat crop is exported, wheat marketing arrangements play an important role in the industry. The Australian Wheat Board (AWB) was constituted in September 1939, under *National Security (Wheat Acquisition) Regulations*, to purchase, sell or dispose of wheat and wheat products. At the end of World War II, the AWB continued to operate under extensions to these regulations, until 1948, when the Commonwealth and States agreed to national marketing arrangements. After a poll of growers had approved the plan the necessary complementary legislation was passed by the Commonwealth and the States. The *Wheat Industry Stabilization Act 1948* established the present AWB to acquire and market all wheat and to administer successive stabilisation plans. The *Wheat Marketing Act 1979* replaced the stabilisation plans with a guaranteed minimum price scheme, applicable to an unlimited quantity of wheat.

### Wheat marketing and pricing arrangements 1984-85 to 1988-89

The basic elements of the new arrangements were negotiated between the Australian Wheatgrowers' Federation (now renamed the Grains Council of Australia) and Commonwealth and State Governments. The enactment of State legislation complementary to the Commonwealth legislation was necessary for the implementation of a national scheme.

Under current arrangements, the AWB continues as a statutory authority responsible for the marketing of wheat in Australia and overseas although it can now issue permits for the domestic sale of stockfeed wheat outside the pooling arrangements. The concept of a guaranteed minimum price is retained. The Board has been given greater commercial freedom but is required to operate in accordance with an approved corporate plan and be accountable to growers as well as parliament. The following are important features in the current plan.

### **Guaranteed Minimum Price**

The Commonwealth Government underwrites wheat returns on a net basis through a Guaranteed Minimum Price (GMP) Scheme. The Australian Standard White (ASW) GMP is set at 95 per cent of the average of the estimated gross return per tonne for all wheat (ASW basis) from the subject season and the lowest two of the previous three seasons less the estimated pool costs per tonne for the subject season. Separate GMPs are established for categories of wheat, the quality of which is above or below ASW, based on the expected market value of the wheat in those categories relative to ASW.

Growers receive a split first advance payment. Upon delivery of the wheat, a grower is paid 90 per cent of the estimated GMP for the relevant category less contributions to research (wheat tax), dockages for non-approved varieties and allowances for storage, handling and transportation charges. When the final GMP has been determined (before 1 March during the subject season), the grower receives the final GMP, increased or decreased by an allowance for the quality of wheat (in addition to the deductions made at the time of delivery), less the interim advance payment already received. Initial allowances may be adjusted by the Board at a later date to reflect actual costs and returns. If the net return per tonne exceeds the GMP, the excess is returned to growers by way of a final payment, which may be made by instalments over a number of years. The government meets any deficiency between the net pool return rate and the GMP.

These arrangements are market related but they provide the industry with support from the government that is designed to help it overcome any major short-run down-turn in producers' returns. Particulars of GMP rates may be found in *Crops and Pastures, Australia* (7321.0).

### **Financial arrangements**

From 1984-85, the AWB with the Minister's approval has been able to borrow overseas up to an amount equal to the aggregate size of expected foreign currency denominated sales in respect of a particular season, provided that amount does not exceed that season's net financing requirement.

### **Domestic pricing**

The domestic price for human consumption wheat is determined each quarter by averaging the quoted export prices for the forward and past quarters and adding a margin to cover the additional costs of servicing the domestic market. The prices for the four quarters from October 1986 ranged from \$184.56 per tonne to \$192.79 per tonne, including \$1.30 per tonne Tasmanian freight levy. This levy applies to all domestic wheat sales and is used exclusively to cover the cost of shipping wheat from the mainland to Tasmania each season.

Domestic prices for industrial and stockfeed wheats are quoted daily by the AWB in the light of its commercial judgment and are related to export prices.

### **Domestic marketing arrangements**

The AWB controls the domestic marketing of wheat although domestic stockfeed wheat may be directly sold by growers to buyers under a permit issued by the AWB. The availability of these permits is governed by guidelines issued by the Federal Minister for Primary Industries and Energy and the relevant State Ministers. Wheat sold pursuant to a stockfeed purchase permit is subject to a deduction to cover wheat research tax, Tasmanian freight, the AWB's administration costs and a reduced bulk handling authority charge. No pooling or GMP provisions or minimum or maximum prices apply in respect of such wheat.

The AWB may also authorise a grower to sell wheat on behalf of the AWB under grower-to-buyer direct delivery transactions. The grower and buyer negotiate quality and freight allowances around the AWB's domestic ASW price applicable for the same end use. The proceeds of sale are incorporated in the AWB's pooling arrangements.

The grower receives payment from the AWB as if he had delivered ASW wheat, adjusted by the abovementioned allowances and a reduction in the relevant bulk handling authority's charge.

Wheat which is retained by a grower for his own use does not come under the control of the AWB.

The AWB has power to import wheat for use on the domestic market.

### Overseas marketing arrangements

Under the 1984 Act, the AWB maintains sole authority for the export of wheat but no longer controls the export of wheat products. The Act extends the powers of the Board in relation to overseas marketing to enable it to enter into tripartite barter arrangements and the sale and shipment of other grains in combination with wheat. The AWB undertakes market research and promotion both within and outside Australia.

### Wheat classification

Unlike the other wheat exporting nations, Australia does not produce red grained wheats, nor does it have the traditional winter or spring wheats found in the northern hemisphere.

All Australian wheats are white grained, and all are planted during the Australian winter months of May, June and July. They grow during the spring months of August, September and October. The harvest commences in Queensland in September/October and gradually progresses southwards, culminating in Victoria and the southern part of Western Australia in January.

The various combinations of wheat varieties, soil fertility and seasonal conditions encountered throughout the Australian wheat belt enable a wide spectrum of recognised wheat types to be produced. These range from high protein hard grained wheats to low protein soft grained wheats.

Before wheat delivered by farmers can be received into the bulk handling system, the wheat must conform to strict receival standards. These standards are set by the AWB and are collectively referred to as Australian Standard White specification, which broadly relates to moisture content (12 per cent maximum), test weight (74 kilograms per hectolitre minimum), no insects, and a range of tolerances for unmillable material, weather damaged and sprouted kernels, foreign matter and foreign seeds.

In addition to the receival standards, a system of varietal control operates Australia-wide in which the AWB can impose a monetary penalty on wheat received according to the variety delivered and the region of production. The aim of this system is to ensure that varieties are grown in areas where the protein content that they are likely to achieve is in line with the processing characteristics of the wheat (grain hardness, milling quality, dough properties), and to highlight to growers the need to grow marketable varieties of wheat.

The system of classification of Australian wheats has evolved in response to changing market demands. The wheats are classified into two broad categories, namely the milling and non-milling classes, according to test weight, grain soundness and other physical factors. Further classification into grades is based on wheat variety, protein content and grain hardness.

Australian wheats of the following categories are suitable for milling purposes:

- Australian Prime Hard
- Australian Hard
- Australian Standard White (ASW)
- Australian Soft
- Australian Durum
- Australian General Purpose 1

Australian General Purpose 2 and Feed categories are non-milling wheats which have incurred weather damage or have some other defect.

There can exist within each category a number of individual classes, many of which have been developed to meet individual customer requirements. Particulars of Australian wheat standards may be found in *Crops and Pastures, Australia* (7321.0).

### Central Grain Research Laboratory

In 1976, the Australian Wheat Board established this laboratory in Sydney as an addition to the facilities of the Bread Research Institute of Australia. The main functions of the laboratory are to test and report on the Australian crop, to analyse and compare competitor wheats from other countries and to develop research programs to aid the marketing of wheat.

**WHEAT: AREA, PRODUCTION AND RECEIVALS**

| Season            | Area (a)  |              | Production (a) |             | Australian Wheat Board receivals (b) |

(a) Due to amendments to the *Wheat Marketing Act 1979*, the AWB has changed from a December-November to an October-September crop year. To facilitate this transition, 1981-82 was a 10 month (December-September) reporting period.

**Wheat pools**

Details of wheat receivals by State of origin for the several Pools together with Pool payments and times of payment will be found in the latest issue of *Crops and Pastures, Australia* (7321.0).

**International Wheat Agreement**

A number of Agreements have operated since 1933 to provide a valuable framework for continuing international consultation and co-operation on world wheat matters, including the regular monitoring of the world wheat situation. On 1 July 1986, the International Wheat

Agreement 1986 entered into force and will remain in force until 30 June 1991. It comprises two separate legal instruments, the Wheat Trade Convention and the Food Aid Convention, linked by a common preamble. The primary objective of the Wheat Trade Convention is to promote international co-operation in all aspects of trade in wheat and other grains. Under the Food Aid Convention, countries undertake to provide minimum annual amounts of food grain as aid. Contributions are made by both wheat importing and exporting countries in the form of grain (or grain products) for human consumption or cash for the purchase of grain.

#### WHEAT EXPORTS: A COMPARISON WITH OTHER EXPORT COMMODITIES<sup>(a)</sup>

Australia acceded to the Wheat Trade Convention, 1986 in July 1986. Major changes from the previous Wheat Trade Convention, which operated from 1971, include expansion to cover coarse grains and amendments to reflect the fact that the Convention does not contain economic provisions. The Wheat Trade Convention through its plenary body, the

International Wheat Council (IWC), provides a forum for exchange of information and discussion of members' concerns regarding trade in grains. In the context of the current round of GATT Multilateral Trade Negotiations, Australia has proposed that the IWC Secretariat undertake a study examining the effects of changes in national policies on world grains markets.

Australia made a formal application to accede to the Food Aid Convention, 1986 at the 53rd Session of the Food Aid Committee in December 1986 with a minimum annual contribution of 300,000 tonnes, compared with 400,000 tonnes under the previous Convention. The decision to reduce the level of Australia's commitment was made against the background of the severe economic difficulties being experienced in Australia which, inter alia, have effectively reduced our capacity to provide development assistance, including food aid. Australia's application was accepted at the 54th Session of the Food Aid Convention in June 1987.

### Coarse grains

In the late sixties and early seventies, restrictions on wheat deliveries and low returns in the sheep industry caused a resurgence of interest in coarse grain crops and the newer oilseed crops. The resultant higher level of plantings and production has been maintained, despite the lifting of wheat delivery quotas and a general improvement in market prospects for wheat, wool and meat.

### Oats

Oats are traditionally a cereal of moist temperate regions. However, improved varieties and management practices have enabled oats to be grown over a wide range of soil and climatic conditions. They have a high feed value and produce a greater bulk of growth than other winter cereals; they need less cultivation and respond well to superphosphate and nitrogen. Oats have two main uses: as a grain crop, or as a fodder crop, (following sowing or fallow or rough sowing into stubble or clover pastures). Fodder crops can either be grazed and then harvested for grain after removal of livestock or else mown and baled or cut for chaff. Oats produced in New South Wales are marketed through a statutory board while the Victorian Oatgrowers' Pool and Marketing Company Ltd and private merchants market the bulk of oats produced in Victoria. In South Australia the Barley Marketing Act was amended in 1977 to give the Australian Barley Board powers over oat marketing in that State. Under the legislation amendments, the Board controls export sales and grain resold on the local market; however, direct sales between producers and consumers are outside the Board's supervision. In Western Australia, oats are marketed under a warehousing system operated by Co-operative Bulk Handling Ltd.

Oats are usually next in importance to wheat and barley among the grain crops. About three-quarters of the crop is used domestically as stockfeed or for human consumption.

#### OATS FOR GRAIN: AREA, PRODUCTION AND EXPORTS

| Year    | Area    | Production  |             | Exports     |              |

| 1985-86 | 1,068   | 1,330       | 138.3       | 185         | 25.1         |

### Barley

This cereal contains two main groups of varieties, 2-row and 6-row. The former is generally, but not exclusively, preferred for malting purposes. Barley is grown principally as a grain crop although in some areas it is used as a fodder crop for grazing, with grain being subsequently harvested if conditions are suitable. It is often grown as a rotation crop with wheat, oats and pasture. When sown for fodder, sowing may take place either early or late

in the season, as it has a short growing period. It may therefore provide grazing or fodder supplies when other sources are not available. Barley grain may be crushed to meal for stock or sold for malting.

Crops sown for malting purposes require a combination of light textured soil of moderate fertility, reliable rainfall, and mild weather during ripening. The main barley-growing areas in Australia are situated in South Australia, but considerable quantities are also grown in New South Wales, Western Australia, Victoria and Queensland. In December 1980, a joint Commonwealth/industry research scheme for the barley industry commenced operation. The scheme is financed by a levy on barley production and a Commonwealth contribution not exceeding the total of the levy.

Barley is marketed by statutory marketing authorities in each of the mainland States. The Australian Barley Board controls marketing in both South Australia and Victoria, while separate authorities operate in the three other States.

#### Grain sorghum

The sorghums are summer growing crops which are used in three ways: grain sorghum for grain; sweet or fodder sorghum, sudan grass and, more recently, columbus grass for silage, green feed and grazing; and broom millet for brooms and brushware.

Grain sorghum has been grown extensively only in the last two decades. Rapid increases in production have resulted in a substantial increase in exports over this period. The grain is used primarily as stockfeed and is an important source for supplementing other coarse grains for this purpose.

The climatic conditions of Queensland and northern New South Wales are particularly suited to the growing of sorghum. In Queensland, grain sorghum production is concentrated in the Darling Downs, Fitzroy and Wide Bay-Burnett Divisions. In New South Wales, the northern and north-western slopes and plains are the main areas.

In Queensland, a degree of orderly marketing is ensured by the operation of the Central Queensland Grain Sorghum Marketing Board (a statutory authority in a defined area in central Queensland). A State statutory marketing board handles sorghum grown in New South Wales.

#### GRAIN SORGHUM: AREA, PRODUCTION AND EXPORTS

| Year              | Area    | Production  |             | Exports     |              |

|                   |         |             |             |             |              |
|                   | '000 ha | '000 tonnes | \$m         | '000 tonnes | \$m          |
| 1980-81 . . . . . | 657.9   | 1,203.9     | 152.0       | 462.7       | 57.5         |
| 1981-82 . . . . . | 648.6   | 1,316.7     | 140.1       | 1,270.9     | 152.8        |
| 1982-83 . . . . . | 706.5   | 958.0       | 124.4       | 445.0       | 53.9         |
| 1983-84 . . . . . | 730.3   | 1,885.5     | 246.3       | 772.1       | 110.7        |
| 1984-85 . . . . . | 723.0   | 1,369.0     | 196.9       | 1,593.6     | 242.1        |
| 1985-86 . . . . . | 734.2   | 1,415.7     | 180.8       | 1,234.2     | 177.6        |

## Maize

Like sorghum, maize is a summer cereal demanding specific soil and climatic conditions. Maize for grain is almost entirely confined to the south-east regions and Atherton Tablelands of Queensland; and the north coast, northern slopes and tablelands and the Murrumbidgee Irrigation Area in New South Wales. Small amounts are grown in all States, except South Australia, for green feed and silage, particularly in association with the dairy industry.

A statutory board controls the marketing of maize in the Atherton Tablelands area of Queensland. A large proportion of the crop is sold directly to food processors.

### MAIZE: AREA, PRODUCTION AND EXPORTS

| Year    | Area    | Production  |             | Exports     |              |
|---------|---------|-------------|-------------|-------------|--------------|
|         |         | Quantity    | Gross value | Quantity    | Value f.o.b. |
|         | '000 ha | '000 tonnes | \$m         | '000 tonnes | \$m          |
| 1980-81 | 56.5    | 172.8       | 26.1        | 29.1        | 3.4          |
| 1981-82 | 61.0    | 212.4       | 29.6        | 14.2        | 1.9          |
| 1982-83 | 64.3    | 139.1       | 23.3        | 18.3        | 2.4          |
| 1983-84 | 68.4    | 238.2       | 35.6        | 19.0        | 2.8          |
| 1984-85 | 102.9   | 291.4       | 46.1        | 139.8       | 24.9         |
| 1985-86 | 84.2    | 277.7       | 40.4        | 81.3        | 13.2         |

## Rice

In Australia, rice was first grown commercially in 1924-25 in the Murrumbidgee Irrigation Area, one of three irrigation areas in southern New South Wales where rice is now produced. Today, about 97 per cent of Australia's rice is grown in New South Wales. The remainder is grown in the Burdekin River basin and at Mareeba in Northern Queensland.

Rice is a summer growing crop in New South Wales. The combination of irrigation water and the relatively cloudless days characteristic of summers in temperate regions of the world is the main contributing factor to the very high yields per hectare often achieved by New South Wales growers. In Queensland, a winter and a summer crop are grown.

State statutory marketing boards are responsible for the marketing of the New South Wales and Queensland crops.

### RICE: AREA, PRODUCTION AND EXPORTS

| Year    | Area    | Production  |             | Exports     |              |
|---------|---------|-------------|-------------|-------------|--------------|
|         |         | Quantity(a) | Gross value | Quantity    | Value f.o.b. |
|         | '000 ha | '000 tonnes | \$m         | '000 tonnes | \$m          |
| 1980-81 | 103.9   | 727.5       | 138.2       | 281.3       | 99.9         |
| 1981-82 | 122.9   | 853.9       | 103.5       | 596.3       | 195.4        |
| 1982-83 | 84.8    | 547.7       | 88.4        | 404.7       | 120.3        |
| 1983-84 | 119.0   | 632.2       | 88.9        | 245.6       | 91.9         |
| 1984-85 | 122.0   | 865.7       | 123.1       | 341.4       | 121.7        |
| 1985-86 | 106.6   | 716.1       | 80.5        | 177.9       | 77.0         |

(a) In terms of paddy (or rough) rice.

## Oilseeds

### Specialised oilseeds

The oilseeds industry is a relatively young industry by Australian agricultural standards. Production has increased rapidly in recent years following changes in relative profitability and agronomic advances. The expected profitability of oilseeds relative to crops such as wheat and coarse grains will continue to influence future production levels in the industry. This profitability will be related to domestic and international markets for protein meals and vegetable fats and oils.

The specialist oilseed crops grown in Australia are sunflower, soybeans, rapeseed, safflower and linseed. Sunflower and soybeans are summer grown while the others are winter crops. In Australia, oilseeds are crushed for their oil, which is used for both edible and industrial purposes and protein meals for livestock feeds.

Oilseed crops are grown in all States but the largest producing regions are the grain growing areas of the eastern States.

#### **Sunflower**

When crushed, sunflower seed yields a high quality dual purpose oil used primarily to manufacture margarine, salad and cooking oils.

Queensland produces about two-thirds of the Australian crop with the Darling Downs and Central Highlands being the major regions. New South Wales is the next largest producer with the north-west of the State dominating production. Smaller amounts are produced in all other States except Tasmania.

#### **Soybeans**

The major uses of soybean oil are in salad and cooking oils and margarine. Small amounts are used in the production of paints, detergents and plastics. Soybeans also yield a high protein feed for livestock with a small proportion used to manufacture adhesives and synthetic fibres and meats.

Queensland and New South Wales produce virtually all of Australia's soybean crop. The main producing areas are the irrigation districts of the Darling Downs and northern New South Wales. Lesser areas include the Burnett and Lockyer regions of Queensland, while production of raingrown soybeans is expanding on the North Coast of New South Wales.

In irrigated areas, soybeans have increasingly been used as a rotational crop for cotton.

#### **Rapeseed**

The main use of rapeseed oil has been in salad and cooking oils and in margarine with a small amount being used for industrial purposes.

The major production areas are the tablelands and western slopes of New South Wales followed by the south-east of South Australia and the Western Districts of Victoria. Smaller levels of production occur in the South Coast region of Western Australia.

Following significant increases in the 1960s and 1970s, rapeseed production declined rapidly due to problems of blackleg disease and erucic acid content. Production has recovered in recent years with the development of varieties to overcome these problems and in response to the crop rotation benefits of rapeseed.

#### **Safflower**

The oil from safflower is used in the production of cooking oil, margarine, soaps, paints, varnishes, enamels and textiles. In recent years, New South Wales and Queensland together have produced around 90 per cent of Australian output. In Queensland, most production occurs in the Central Highlands with smaller amounts coming from the Dawson-Callide Valley and the Darling Downs. New South Wales production is centred on the Central West.

Wide fluctuations in safflower production since the mid-1960s have been due to variable seasonal conditions affecting yields and the profitability of other crops which has influenced plantings.

#### **Linseed**

The oil from crushed linseed is used in the manufacture of paints, varnishes, technical inks and linoleum.

The main producing areas are the wheat belt of New South Wales, the Darling Downs in Queensland, the Western Districts of Victoria and, to a lesser extent, the south-eastern districts of Victoria. Linseed production has been generally declining in recent years.

#### **Other oilseeds**

Peanuts and cottonseed are summer crops grown primarily for human consumption and fibre purposes respectively. The rapid expansion of the cotton industry in recent years has resulted in cottonseed becoming the major oilseed in Australia. Cottonseed oil is used mainly in the manufacture of compound cooking fats and margarine. The least important source of vegetable oils in Australia is peanuts as it is only the low quality kernels which are crushed

Harvesting wheat in Northern N.S.W.

for oil. Crushings may vary between 3,000 and 7,000 tonnes per annum depending on the quality of the crop. Peanut oil is a high quality oil which is used in the manufacture of margarine and in compound cooking fats and is also used as a cooking and salad oil.

**Peanuts**

The major peanut growing areas are around Kingaroy in south-east Queensland and the Atherton Tablelands in North Queensland, with smaller pockets of production around Tweed Heads in New South Wales and around Douglas in the Northern Territory.

About 80 per cent of peanuts grown in Australia are of Virginia variety, the remainder being of Spanish types.

Although area planted to peanuts has stabilised in recent years at around 25,000 to 33,000 hectares, production has fluctuated depending on seasonal conditions. Output in 1985-86 is estimated to total some 43,500 tonnes compared with 42,400 tonnes produced in 1984-85.

Local demand for peanuts and peanut products is comparatively static with a limited potential for growth corresponding to population growth. The local growing industry normally supplies most of the domestic demand for edible peanuts in its major outlets: peanut butter, packaged trade and confectionery. Any surplus is sold on export markets. Exports vary according to the size of the crop.

**SELECTED OILSEED CROPS: AREA, PRODUCTION AND GROSS VALUE**

| <i>Year</i>              | <i>Sunflower</i> | <i>Soybeans</i> | <i>Rapeseed</i> | <i>Safflower</i> | <i>Linseed</i> | <i>Total</i> |

**Cotton**

Cotton is grown primarily for its fibre (lint). When the cotton is matured, seed cotton is taken to a gin where it is separated (ginned) into lint, seed and thrash. Lint is used for yarn while seed is further processed at an oil mill. There the short fibres (linters) remaining on the seed after ginning are removed. They are too short to make into cloth but are used for

wadding, upholstery and paper. The seeds are then separated into kernels and hulls. Hulls are used for stock feed and as fertiliser, while kernels are crushed to extract oil. The remaining cake is ground into meal which is protein roughage used as stock feed.

Over three-quarters of Australia's total production of cotton lint is grown in New South Wales, principally in the Namoi, Macquarie, Gwydir and McIntyre Valleys and the Bourke area. Irrigation water for these areas is provided from the Keepit, Burrendong, Copeton and Glenlyon Dams and the Darling River. The rest is grown in Queensland, in the Emerald, Biloela, St George, and Darling Downs areas. Most of these areas are also irrigated. Australian production has for some time satisfied most of the requirements of local mills for short and medium staple cotton. Since the mid-1970s there has been very strong investment growth in the cotton industry and the resultant surge in plantings has resulted in large amounts of cotton becoming available for export.

#### COTTON: AREA, PRODUCTION AND EXPORTS

| Year              | Area    | Seed cotton (a) |             |                | Raw cotton export |             |              |
|-------------------|---------|-----------------|-------------|----------------|-------------------|-------------|--------------|

## Sugar

Sugar cane is grown commercially in Australia along the east coast over a distance of some 2,100 kilometres in a number of discontinuous areas from Maclean in northern New South Wales to Mossman in Queensland. The geographical spread contributes to the overall reliability of the sugar cane crop and to Australia's record as a reliable sugar supplier.

Approximately 95 per cent of production occurs in Queensland, with some 75 per cent of the crop grown north of the Tropic of Capricorn in areas where rainfall is reliable and the warm, moist and sunny conditions are ideal for the growing of sugar cane. Farm sizes range between 20 and 70 hectares.

Australian cane farmers are regarded as amongst the most efficient in the world and employ a high degree of mechanisation in ploughing, planting, harvesting, and transportation activities. The Australian industry was the first in the world to introduce mechanical cultivation and harvesting techniques and by 1964 the entire industry had converted to bulk handling.

The cane crop is generally planted in April/May and harvested from June to December the following year. The major proportion of each year's crop is from ratoons while in New South Wales most crops are allowed to grow for two seasons due to the slower growing conditions.

The organisation of the Australian sugar industry is complex. The Queensland Government controls the quantity of raw sugar produced through a system of mill peaks which is translated into cane quotas for growers. In addition the Queensland Government contracts with CSR Limited and Millaquin Sugar Company Pty Limited for the refining, marketing and distribution of home consumption needs, arranges through CSR Limited the export marketing of raw sugar, and regulates the division of industry proceeds between growers and millers.

There are 33 raw sugar mills located throughout the growing regions: 30 are located in Queensland and the remaining three in New South Wales. Fifteen of the mills are co-operatively owned by canegrowers and the remaining eighteen by proprietary companies. Refineries are located in each mainland capital city and at Bundaberg. The six bulk sugar export terminals located in Queensland are at present capable of storing 2.9 million tonnes. While raw sugar is the main product from mills, important by-products are bagasse (fibre), molasses, ash and filter mud.

In recent years sugar cane production has been around 24 million tonnes yielding between 2.8 and 3.3 million tonnes of sugar. Area, production and yield levels for sugar cane from 1980-81 to 1985-86 are provided in the following table.

**SUGAR CANE: AREA, PRODUCTION AND YIELD**

| Year              | New South Wales             |             |       |              |       | Queensland                  |             |       |              |       |
|-------------------|-----------------------------|-------------|-------|--------------|-------|-----------------------------|-------------|-------|--------------|-------|

(a) In terms of 94 net titre.

The domestic market is reserved entirely for sugar produced in Australia. This is achieved by an embargo on the import of sugar. The maximum price of refined sugar for sale to wholesalers and manufacturers is fixed each six months under a formula contained in the Commonwealth/Queensland Sugar Agreement.

Domestic sales account for about 760,000 tonnes annually or approximately 20 per cent of the total industry sales. Granulated sugars account for about 75 per cent of the total domestic sales with liquid sugars (15 per cent), castor sugar (5 per cent), and raw sugar taking up the bulk of the remainder. About two-thirds of the sales of refined sugar products go to processed food and drink manufacturers.

The Australian sugar industry exports about 75 per cent of its annual raw sugar production and is one of the world's largest sugar exporters. The disposal pattern of Australia's sugar production is shown in the following table.

**SUGAR: AREA, PRODUCTION, EXPORTS AND CONSUMPTION**

| Year              | Area harvested | Production |             |           | Exports               |              | Apparent consumption in Australia(a) |             |

(a) Total quantity of sugar available for consumption in Australia comprises refined sugar and refined sugar contained in manufactured foods.

Australia has regularly participated in arrangements to regulate the international sugar market and was a signatory to the 1984 International Sugar Agreement (ISA). The Agreement is an administrative pact only, and unlike previous Agreements contains no economic provisions. This means that member countries are not constrained in their sugar exports.

**Vegetables**

**Vegetables for human consumption**

The area sown to vegetables reached a peak of over 200,000 hectares in 1945, but has remained static at around 109,000 hectares since 1975-76. However, yields from most vegetable crops have increased due to variety breeding for increased yields, greater use of

irrigation and better control of disease and insect pests.

Because of the wide climatic range in Australia, supplies for main city markets are drawn from widely different areas, depending on the times of maturity of the various crops. Historically, market gardens were located near urban centres and, while many small scale growers still produce crops close to city markets, urban expansion, rising urban land values, improvements in transport and irrigation, and developments in freezing, canning and drying have extended the industry far from the cities. Transport costs are reduced by the location of processing establishments in producing areas, although city markets still absorb the bulk of fresh and processed produce.

For further information on vegetables see *Year Book* No. 70.

**APPARENT CONSUMPTION OF VEGETABLES**  
(kilograms per capita per year)

| Year              | Potatoes | Other root and bulb vegetables | Tomatoes | Leafy and green vegetables | Other vegetables | Total, fresh equivalent weight |

(a) Incomplete, information on this commodity was not separately collected in some States.

For further information on vegetables see the following publications: *Crops and Pastures, Australia* (7321.0), *Apparent Consumption of Foodstuffs and Nutrients, Australia* (4306.0) *Value of Agricultural Commodities Produced, Australia* (7503.0), and *Year Book* No. 70.

### Fruit (excluding grapes)

A wide variety of fruit is grown in Australia ranging from pineapples, mangoes and papaws in the tropics to pome, stone and berry fruits in the temperate regions.

In recent years there has been rapid expansion in the cultivation of many relatively new fruit crops in Australia and there is considerable scope for continued growth in the future.

Avocado is perhaps the most commonly known of these crops and production has expanded considerably during the past decade to a current gross value of over \$10m. Avocado production is mainly in Queensland and New South Wales with minor quantities produced in Western Australia, South Australia and Victoria.

Kiwifruit is a relatively new temperate fruit crop to Australia. Production has been expanding rapidly mainly in Victoria and New South Wales and further expansion is expected. Of the berry fruits, strawberries are widely grown, with largest production in Victoria and Queensland. Interest in the production of blueberries in Australia has developed only recently and plantings of blueberries have increased rapidly mainly in Victoria and New South Wales. Other berries (currants and raspberries) are grown predominantly in Tasmania and production has been reasonably constant over the past five years.

Tropical fruit such as mangoes, papaws, passionfruit, custard apples and guavas, are grown mainly in Queensland. Smaller quantities of tropical fruit are produced in the north coast region of New South Wales, Western Australia and more recently the Northern Territory. The largest expansion has been of mango production which has more than doubled since 1979. Given the large number of non-bearing mango trees production is expected to continue to increase dramatically. There is also considerable interest in many other exotic tropical and subtropical fruits. Production of lychees and persimmons has recently commenced and some plantings of rambutan, sapote and longans have been made, mainly in Queensland and the north coast region of New South Wales.

Almond is still the major nut crop in Australia with almost the entire almond crop produced in South Australia and Victoria. Pecan nut production increased substantially in the 1970s, mainly in northern New South Wales. More recently plantings of pistachio trees have commenced in South Australia, Victoria, New South Wales and Western Australia. The major expansion in the nut crops has been with macadamias, a native Australian tree. The main growing regions are the coastal region of northern New South Wales and southern Queensland. During the past decade production of macadamia nuts has increased rapidly to a current gross value of about \$4 million.

## Processed fruit and fruit products

After rapid expansion in the 1960s, output of canned fruit declined and then levelled off due to the effects of contracting overseas markets for Australian canned fruit. Production of natural fruit juices has increased markedly in the last decade and this has reflected improvements in marketing methods, effective promotion and public awareness of the nutritional value of natural juices.

### FRUIT PRODUCTS

(Derived from the Annual Manufacturing Census and the recorded monthly production)

## Fruit exports

The value of exports of fruit and fruit products (excluding grapes) has in most recent years accounted for more than a quarter of the value of the production of fresh fruit. Fresh or chilled fruit (mostly apples, pears and citrus) account for some 40 per cent of this; preserved fruit (mostly canned pears and peaches) make up most of the remainder; only small quantities of dried fruits (other than grapes) are exported. The total value of those exports has been relatively constant in recent years.

### FRUIT EXPORTS: VALUE F.O.B.

(\$ million)

| Year    | Fresh and chilled |       |         | Canned or bottled |         |       |                      |                 |                |

Fresh apple exports to Europe have been markedly reduced in recent years mainly because of rising shipping costs and improved storage techniques in Europe. On the other

hand, markets in other areas such as South East Asia and the Middle East have been maintained in most years. Fresh pear exports to Europe have also declined but not to the same extent as apples. Other export markets for pears, such as South East Asia, have gained importance in recent years. Exports of citrus, predominantly oranges, were relatively steady at around 30,000 tonnes for the five years to 1984-85 but increased rapidly to an estimated 50,000 tonnes in 1986-87. Citrus exports are sensitive to competition from the U.S.A. Exports of oranges were made to Japan for the first time in 1983-84, and sales in subsequent years have been steadily expanding. The Australian industry believes there is a potentially very important trade with Japan.

(a) Fruit and nuts, excluding grapes (fresh and dried); includes fresh, dried and preserved and fruit preparations.

### Fruit imports

Small but increasing quantities of fresh fruit, mainly off-season citrus from the U.S.A., are imported, while most imports of dried fruit consist of dates from China and Pakistan and dried apricots from Turkey. Imports of orange juice increased to a peak of 106 million litres in 1983-84, but have since declined to 55 million litres in 1985-86.

### Marketing and regulation of the fruit industry

#### Apples and pears

The Australian Apple and Pear Corporation has the function of promoting and controlling the export of Australian apples and pears as well as the promotion of trade and commerce in apples and pears within Australia. It also has power to promote, or engage in, research relating to the production, packaging, handling, transportation or marketing of apples and pears and to promote new apple and pear products.

The current underwriting schemes for export apples and pears terminate at the end of the 1990 export season. Under the schemes, the government guarantees a minimum export return separately for 'at risk' and forward sales of apples and pears which is equal to 85 per cent of the average export returns in the last three of the previous four years. If the average export return for any of the four categories of exports should fall below the bigger price in any year, the government will make up the difference without limit.

#### Canned fruit

On 29 November 1979 the Commonwealth enacted legislation restructuring the industry's marketing arrangements. Similar complementary legislation has been enacted by the four States of New South Wales, Victoria, South Australia and Queensland.

Under the legislation, the Australian Canned Fruits Corporation (replacing the Australian Canned Fruits Board) is empowered to acquire and sell the production of canned apricots, peaches and pears and is responsible for determining prices, terms and conditions for sales in both Australian and export markets. Sales are made through markets nominated by canners and approved by the Corporation. Markets are classified as Pool and Non-Pool with returns from Pool markets equalised by the Corporation. Entitlements for sales in Pool markets are allocated to canners prior to the start of each season.

The Corporation's administrative expenses are financed by a levy imposed on the production of canned fruits under the *Canned Fruits Levy Act 1979*.

The Corporation is advised in the performance of its functions by the Australian Canned Fruits Industry Advisory Committee.

In October 1984, the operation of the Australian Canned Fruits Corporation (ACFC) was extended for a further three years to the end of 1987. A more commercially orientated and flexible corporation was achieved with the expansion of the Corporation's board to make it more effective in its commercial operations, more accountable to industry and government and more capable of achieving its objective of improving returns to growers.

For further data on fruits and fruit products see the publications *Fruit, Australia (7322.0)*, *Production Bulletin No. 3: Food, Drink and Tobacco, Australia (8359.0)*, *Apparent Consumption of Foodstuffs and Nutrients, Australia (4306.0)* and *Value of Agricultural Commodities Produced, Australia (7503.0)*.

## Grapes

Grapes are a temperate crop which require warm to hot summer conditions for ripening and predominantly winter rainfall. Freedom from late spring frosts is essential. They are grown for wine-making, drying and, to a lesser extent, for table use. Some of the better known wine producing areas are the Barossa, Clare, Riverland, Southern Districts and Coonawarra (S.A.); North Eastern Victoria and Great Western (Vic.); Hunter and Riverina (N.S.W.); Sunraysia (N.S.W. and Victoria); Swan Valley and Margaret River (W.A.).

Nearly all the dried fruit is produced along the River Murray and its tributaries in Victoria and New South Wales with small localised areas in other States.

### VITICULTURAL STATISTICS: AREA, PRODUCTION AND VALUE

| Year              | Area    |         | Production: grapes used for— |                             |                             |             |

(a) Includes grapes used for table and other purposes.

Multipurpose grapes are used predominantly for winemaking and drying, the latter process being particularly susceptible to adverse seasonal conditions. A serious oversupply of dried vine fruit existed on world markets in 1983 and 1984, however the situation has improved since 1985 as a consequence of reduced production from northern hemisphere suppliers in late 1984. Australian exporters have made significant sales on international markets. The Australian Dried Fruits Corporation is the body responsible for the organisation of the export trade in dried vine fruits. The Corporation also administers the statutory Dried Vine Fruits Equalisation Scheme and the Dried Sultana Production Underwriting Scheme. Both these schemes were restructured by the Government in 1985 following an inquiry into the dried vine fruits industry by the Industries Assistance Commission. The Government's objective was to make the industry more responsive to market signals. Until 1983, imports of dried vine fruit had been largely insignificant. However, since that time significant imports have occurred each year, the major sources being Greece and the U.S.A. The Australian industry has demonstrated injury from subsidised imports from Greece and countervailing measures have been implemented.

**Wine industry**

Australia produces a wide range of wine and brandy products. Over the past twenty years there has been a distinct trend towards greater production and consumption of unfortified or table wines. In the twelve months ending June 1986 sales of table wine accounted for nearly 78 per cent of all sales of Australian wine. The large growth in table wine sales has been principally due to the successful marketing of wine in 'casks' (usually fibreboard, box-shaped, 4 litre containers equipped with dispensing faucets).

Exports and imports of wine are relatively insignificant accounting respectively for 2.5 per cent of production and 3.7 per cent of the apparent domestic market for wine. Legislation reconstructing the Australian Wine and Brandy Corporation as the body responsible for the control of the export trade in wine, brandy and grape spirit products was enacted in June 1986. The Corporation has the power to regulate exports as well as organise promotion and publicity functions in export markets and in Australia.

### PRODUCTION, CONSUMPTION AND EXPORT OF WINES

| Other (incl. nurseries) . . . . . | 331.1       |                                          | 4.5 |

### Fodder crops

As well as crops specifically for grain, considerable areas of Australia are devoted to fodder crops. These crops are utilised either for grazing (as green feed), or conserved as hay, ensilage, etc.

This development of fodder conservation as a means of supplementing pasture and natural sources of stockfeed is the result of the seasonal and comparatively unreliable nature of rainfall in Australian agricultural areas.

#### FODDER CROPS: AREA AND PRODUCTION

| Year              | Hay(a)  |             |             | Green feed or silage(b) |             |
|-------------------|---------|-------------|-------------|-------------------------|-------------|

| 1985-86 . . . . . | 268     | 820         | 64.5        | 1,062                   | 620         |

a) Principally oaten and wheaten hay.

(b) Principally from oats, barley, wheat and forage sorghum.

### Lupins

Lupins are grown primarily as a grain crop, but grazing of standing crops and stubble is also an important use. Because of their high protein content, lupins are becoming increasingly important in livestock feed and for human consumption, particularly in some of the Asian countries.

There has been a significant expansion of lupin production in recent years, particularly in Western Australia which is the major producer and exporter of lupins. Smaller quantities are also grown in New South Wales, Victoria and South Australia mainly for domestic use.

**Tobacco**

Tobacco is a summer-growing annual which requires a temperate to tropical climate, adequate soil moisture and a frost-free period of approximately five months. In Australia, all tobacco is grown under irrigation. Because of specialised requirements, production is limited to areas with suitable soils and climate. The main centres of production are the Mareeba-Dimbulah districts of north Queensland and Myrtleford in north-eastern Victoria. Other areas where tobacco is grown include Bundaberg, Beerwah and Texas (Queensland) and Yetman and Coraki (New South Wales). All tobacco grown in Australia is of the flue-cured type except for small quantities of burley tobacco produced mainly in Victoria.

**TOBACCO: AREA, PRODUCTION AND OVERSEAS TRADE**

**Marketing**

In 1965 the Commonwealth and State Governments agreed to a stabilisation plan which provided for an annual Australian tobacco leaf marketing quota of flue-cured tobacco and a guaranteed minimum average reserve price. The plan is administered by the Australian Tobacco Board, constituted under the *Tobacco Marketing Act 1965*, and is composed of representatives of the Commonwealth Government, tobacco-growing States, growers and manufacturers.

Following a review by the Industries Assistance Commission of the tobacco industry in 1982, the Government announced a new 5-year stabilisation scheme which began in 1984. The new scheme is designed to rationalise marketing arrangements in the industry. The scheme provides that the annual tobacco leaf quotas are adjusted in line with consumption, that manufacturers' stocks are reduced to a level equivalent to 13 months' consumption by 1988, and that prices be adjusted so as to significantly reduce the gap between Australian and world prices by 1990.

**Hops**

Hops are grown from perennial rootstocks over deep, well-drained soils in localities sheltered from the wind. The hop-bearing vine shoots are carried upon trellises, from which they are later harvested. The green hops are kiln-dried and baled on the farm. The dried hops can be further processed at centralised processing establishments into pellets, extract or high density packs. The pelleted form constitutes the bulk of the exported hops.

The area planted to hops in Australia is about 1,300 hectares. About 65 per cent of plantings are in Tasmania (confined to the Derwent, Huon and Channel areas in the south-east, the Scottsdale-Ringarooma district in the north-east, and the Gunn Plains in the north-west of the State). The other hop producing areas are the Ovens and King Valleys in Victoria and a small area near Manjimup in Western Australia.

Australian hop production is about 2,600 tonnes, approximately 70 per cent of which is used by domestic breweries, with the remainder being exported.

## Mushrooms

Statistics of mushroom growing were collected for the first time in all States for the year ended 30 June 1975.

### MUSHROOMS: AREA, PRODUCTION, GROSS VALUE AND IMPORTS

| Year              | Total production |          |             | Canned or bottled production | Imports  |              |                   |              |
|-------------------|------------------|----------|-------------|------------------------------|----------|--------------|-------------------|--------------|
|                   | Area             | Quantity | Gross value |                              | Dried    |              | Canned or bottled |              |
|                   |                  |          |             |                              | Quantity | Value f.o.b. | Quantity          | Value f.o.b. |

## Jojoba

Jojoba is an arid zone perennial shrub native to the Sonoran Desert in U.S.A. and Mexico where it has a reputation for its ability to survive and grow under extremely adverse conditions. About 50 per cent of seed weight consists of a high quality liquid wax suitable for a wide range of industrial applications.

Attempts are being made to establish a jojoba growing and processing industry in Australia using wild, unimproved planting material. A research backing is needed, and research in this country has investigated the environmental factors controlling flowering and fruit growth, the physiological basis of jojoba's adaptation to moisture and temperature extremes, and the sites with the best potential to support an industry.

The future development of a jojoba industry depends upon the use of improved, high-yielding plant lines and the selection of the best plantation sites. Although there are many proposed uses for the wax, future market size and price structure are unknown.

## Livestock

Since 1861, annual enumerations of livestock have been made based, with few exceptions, on actual collections made through the agency of the State police or by post. Particulars concerning the numbers of each of the principal kinds of livestock in Australia at ten-yearly intervals from 1861 to 1971, and then from 1981 on by single years, are given in the following table.

### LIVESTOCK, AUSTRALIA

('000)

| Year           | Cattle | Sheep   | Pigs  | Year           | Cattle | Sheep   | Pigs  |
|----------------|--------|---------|-------|----------------|--------|---------|-------|
| 1861 . . . . . | 3,958  | 20,135  | 351   | 1951 . . . . . | 15,229 | 115,596 | 1,134 |
| 1871 . . . . . | 4,276  | 41,594  | 543   | 1961 . . . . . | 17,332 | 152,679 | 1,615 |
| 1881 . . . . . | 7,527  | 62,184  | 816   | 1971 . . . . . | 24,373 | 177,792 | 2,590 |
| 1891 . . . . . | 10,300 | 97,881  | 891   | 1981 . . . . . | 25,168 | 134,407 | 2,430 |
| 1901 . . . . . | 8,640  | 70,603  | 950   | 1982 . . . . . | 24,553 | 137,976 | 2,373 |
| 1911 . . . . . | 11,745 | 98,066  | 1,026 | 1983 . . . . . | 22,478 | 133,237 | 2,490 |
| 1921 . . . . . | 13,500 | 81,796  | 674   | 1984 . . . . . | 22,161 | 139,242 | 2,527 |
| 1931 . . . . . | 11,721 | 110,568 | 1,072 | 1985 . . . . . | 22,738 | 149,747 | 2,512 |
| 1941 . . . . . | 13,256 | 122,694 | 1,797 | 1986 . . . . . | 23,436 | 155,561 | 2,553 |

While livestock numbers (particularly sheep) have increased substantially since 1861, marked fluctuations have taken place during the period, mainly on account of widespread droughts which have from time to time left their impressions on the pastoral history of Australia.

Australia has suffered ten major widespread droughts since the keeping of rainfall records began:

**1864–1866** All States were affected except Tasmania.

**1880–1886** Southern and eastern mainland States were affected.

**1888** All States were hit except Western Australia.

**1895–1903** This drought, one of the worst on record, halved Australia's sheep population (originally 100 million) and cut cattle numbers (12 million) by 40 per cent.

**1911–1916** Wheat crops were affected in most States, sheep numbers declined by 19 million and cattle by 2 million.

**1918–1920** During this period, parts of Western Australia were the only areas completely free from drought.

**1939–1945** This prolonged drought affected crops and/or pastoral areas in all States. Sheep numbers fell from 125 million in 1942 to 96 million in 1945.

**1965–1967** This drought, in its impact on Queensland, New South Wales and Victoria, ranked with the 1902 drought as one of the most severe on record. It resulted in a 40 per cent drop in the wheat harvest, a loss of 20 million sheep, and a decrease in farm income of \$300–500 million. There was a chain reaction to other industries, with heavy losses being suffered by manufacturers of farm machinery and the New South Wales Railways. Effects of the drought were worsened by water rationing in irrigation areas.

**1972** Widespread drought occurred throughout Australia.

Much of eastern Australia experienced one of the worst droughts on record in 1982 and early 1983. Widespread and soaking rains during the autumn months of 1983 greatly alleviated the situation and most areas received further good rains during 1983–84. However, 1985 saw the return of light and variable rainfall conditions. In July 1985, much of New South Wales and western Queensland had again been drought declared and regional areas of concern were notified in western Victoria, parts of South Australia and Western Australia, and much of the Northern Territory. Good rains during August 1985 relieved much of this problem.

For further details of droughts in Australia *see* the special article at the end of Chapter 16, on page 620.

The years in which the numbers of livestock attained their peaks are as follows: cattle, 1976 (33,434,000); sheep, 1970 (180,080,000); and pigs, 1973 (3,259,000).

## Cattle

Cattle-raising is carried out in all States, the main object in certain districts being the production of stock suitable for slaughtering purposes and in others the raising of dairy herds. While dairy cattle are restricted mainly to southern and to coastal districts, beef cattle are more widely distributed. Cattle numbers in Australia increased slowly during the 1960s and 1970s, despite seasonal changes and heavy slaughterings, to a peak of 33.4 million in 1976. There was a continuous decline, aggravated by drought conditions, to 22.2 million in 1984. Improved seasonal conditions and higher export prices in 1984 encouraged producers to commence rebuilding herds and numbers increased to 23.4 million in 1986.

Beef cattle production is often combined with cropping, dairying and sheep. In the north (north of the 26th parallel), cattle properties and herd size are very large, pastures are generally unimproved, fodder crops are rare and beef is usually the only product. The industry is more intensive in the south because of the more favourable environment including more improved pasture.

For further details on cattle, *see Livestock and Livestock Products, Australia* (7221.0).

## Sheep

With the exception of a short period in the early 1860s, when the flocks in Victoria outnumbered those of New South Wales, the latter State has occupied the premier position in sheep raising. Western Australia is the second largest sheep raising State, followed by Victoria. Sheep numbers reached a peak of 180.0 million in Australia in 1970. They then declined rapidly up to March 1973 as producers turned off large numbers for slaughter and moved from wool-growing towards grain and beef production. By 1975, the numbers had again increased to 151.7 million, but in March 1978 the numbers had fallen to 131.4 million, the lowest since 1955. Improved seasonal conditions during 1978 and 1979 enabled producers to begin rebuilding their flocks. By March 1980, numbers had risen to 136.0 million. Subsequently, high levels of drought-induced slaughter led to a decline in numbers to 134.4 million by March 1981. Numbers rose to 138.0 million in March 1982 with improved seasonal conditions and the attractiveness of sheep enterprises relative to cattle contributing to the growth in numbers. Subsequently, drought conditions saw the flock reduce to 133.2 million in March 1983. The increase in flock numbers to 139.2 million in March 1984 reflects flock rebuilding by producers in response to favourable seasonal conditions beginning in the autumn of 1983, improved lambing rates, and a favourable outlook for wool and live sheep enterprises. This trend continued and, in March 1986, flock numbers reached 155.6 million.

The combined value of wool and sheep slaughtered during 1985-86 is estimated at 20.5 per cent of the gross value of agricultural commodities. This proportion varies with wool and meat prices and seasonal conditions. Australia has about 20 per cent of the world's woolled sheep but produces around 25 per cent of the world's greasy wool output. In addition, in the year ended 30 June 1986 the sheep industry produced 578,000 tonnes of mutton and lamb. Exports of live sheep for slaughter during the same period totalled 6.4 million head, with Kuwait and Saudi Arabia accounting for 61 per cent of the total.

**Pigs**

Over the past 30 years there have been significant changes to the structure of the Australian pig industry. Initially, pigs were raised as part of a dairying operation where there were abundant supplies of liquid skim milk. Today, however, with introduction of factory separation of milk and cream, coupled with the low grain prices of the 1960s, pig raising has become more and more associated with grain production.

In addition there has been a major move away from the so called extensive method of pig raising to the intensive conditions that apply today. This has meant an increase in the capital investment in the industry and a greater degree of specialisation in pig raising. The average pig production unit today would be based on approximately 300 sows with feeds being almost exclusively grain based. While the number of sows in Australia has remained fairly constant the number of pig farmers has decreased.

## Poultry

The commercial poultry industry comprising hatcheryworkers, egg producers and broiler growers is highly specialised, although a proportion of production comes from 'backyard' egg producers, roughly estimated at from 20 to 25 per cent of the total. There are also separate research schemes funded jointly by industry and government for the egg and meat chicken industries but close liaison exists. Both sectors are good examples of specialised, large scale, capital-intensive production.

(a) Data are for numbers of poultry on agricultural establishments as reported in the annual Agricultural Census.

(b) Includes breeding stock and data not available for separate publication.

For further details on pigs and poultry see the publication *Livestock and Livestock Products, Australia* (7221.0).

## Meat production, slaughterings and other disposals

The ABS collects details of slaughterings and meat production from abattoirs, commercial poultry and other slaughtering establishments and includes estimates of animals slaughtered on farms and by country butchers. The data relate only to slaughterings for human consumption and do not include animals condemned or those killed for boiling down.

Mutton and lamb

Production of sheepmeats in Australia is closely associated with the wool industry. Sheep grazing often occurs on mixed farms in conjunction with beef and/or grain enterprises and in some areas producers specialise in lamb production. The supply of sheepmeat depends greatly on seasonal conditions, decisions to build up or reduce flock numbers, expectations of wool prices, live sheep exports and the pattern of domestic consumption of meat.

There was a movement out of sheep raising in Australia early in the 1970s, principally as a result of low wool prices, and many producers diversified into cattle and grains. Flock numbers declined from a peak of 180.0 million in 1970 to a low of 131.0 million by 1978. After 1978, wool and sheepmeat prices improved and the trade in live sheep for slaughter overseas continued to expand. As a result, the national flock size increased slightly to 136.0 million by March 1980. Since March 1980, flock numbers have fluctuated as a result of climatic and market conditions peaking at 138.0 million in March 1982, before dropping to 133.2 million in March 1983. Total Australian sheep flock in March 1986 is 155.6 million head.

Sheepmeat production declined rapidly from the high levels of the early 1970s, which were associated with flock reduction, to annual levels of between 400,000 and 600,000 tonnes from 1973-74. Lamb production has remained close to 280,000 tonnes per year, while mutton production has varied between 230,000 and 300,000 tonnes in recent years until 1983-84, when it declined to 169,000 tonnes. Production increased to 289,000 tonnes in 1986-87.

A high proportion of lamb is consumed in Australia with per capita consumption remaining steady at about 14-16 kilograms per year. A high proportion of mutton produced is exported. Australia is the world's largest exporter of mutton, with Japan and the Middle East being the main markets.

Live sheep and lamb exports for slaughter during 1986-87 totalled 7.7 million head.

## **Beef and veal**

The cattle industry is very dependent on international trade in beef and is subject to great fluctuations. Over half of Australia's beef and veal production is exported, with the U.S.A. and Japan the main outlets.

Beef and veal production in Australia rose markedly in the 1970s, reaching peak levels of over 2.0 million tonnes in 1977-78 and 1978-79, but declining to 1.3 million tonnes in 1984-85. The increase in production followed the rapid expansion of the beef herd that had occurred during the late 1960s and early 1970s mainly in response to relatively profitable beef prices and increased demand from overseas markets.

In the mid-1970s, poor economic conditions and heavy domestic supplies of beef in major importing countries led them to impose severe restrictions on their imports. With reduced international demand and heavy supplies in Australia, saleyard prices fell greatly and remained low for about four years. The depressed conditions were accompanied by a severe reduction in the national herd.

Improved seasonal conditions during 1983, accompanied by strengthening overseas demand, resulted in a move towards herd rebuilding. However, the high level of drought-induced slaughterings during 1982 had reduced the breeding herd base implying very slow herd expansion until 1986. Higher slaughtering in 1986-87 indicate that there has been a break in the rebuilding due to favourable prices. Current projections by the Australian Meat and Livestock Corporation (AMLC) indicate that cattle numbers will slowly increase throughout the 1980s. The lower levels of slaughter accompanying the rebuilding process suggest a decline in the levels of beef and veal production in coming years. Export demand for beef during 1986-87 improved, in part due to the continuing depreciation of the Australian dollar. Saleyard prices of cattle have reached record levels due to strong competitive demand between graziers and cattle fatteners for a limited supply of cattle.

## **Pigmeat**

Significant changes have taken place in the pig producing industry in recent years. Capital investment and corporate takeovers have seen the emergence of a few large companies producing 30 per cent of all pigs sold in Australia. These moves on top of the trend to more intensive and efficient production techniques have seen pigmeat production rise steadily since 1982 to reach 269,000 tonnes in 1985-86. In addition, there has been an increase in the slaughter weights of pigs reflecting the demands of the fresh pork trade.

It is believed that about 60 per cent of production is processed into bacon, hams and smallgoods, with the rest sold as fresh pork. Less than 2 per cent of the industry's output is exported. The increasing production of pigmeat therefore reflects a steady increase in per capita domestic consumption over the past three years.

In recent years a small but useful market for the meat of feral pigs has been established in Europe.

Prices paid for pigs at auction have varied quite markedly in recent years. However, producers have benefitted from lower prices for feed grains which have prevailed over the past few years.

## **Poultry meat**

The poultry meat industry developed rapidly in the 1970s with both output and consumption rising steeply, although in recent years production has exceeded demand and excess production capacity in the industry continues. Genetic and technical improvements and the

organisation of the industry into large-scale enterprises have raised efficiency and helped to reduce production costs relative to other meats. The price competitiveness of chicken meat compared with other meats, especially beef, continues to improve, consolidating the position of poultry meat as the second most important meat after beef in Australian diets.

**EXPORTS OF FRESH, CHILLED OR FROZEN MEAT**

(a) Production of bacon and ham 'on the bone' is shown in terms of 'bone-in' weight, while production of boneless bacon and ham is shown in terms of 'bone-out' weight. Production of canned bacon and ham, which is reported in terms of 'stated net weight of packs', is included in the 'bone-out' category. (b) Canned weight. Includes bacon, ham and meat and vegetables, but excludes rabbit, poultry and baby foods. (c) Cured carcass weight of smoked or cooked bacon and ham. Includes 'stated net weight of packs' of canned bacon and ham. (d) Canned weight; excludes canned bacon and ham.

**GROSS VALUE OF LIVESTOCK SLAUGHTERINGS AND OTHER DISPOSALS(a)**  
(\$ million)

(a) Includes adjustment for net exports of live animals.

### Consumption

The methodology for calculating meat consumption has been revised for the years 1975-76 to 1983-84 and is now shown purely in carcass weight equivalent terms. Canned meat as such is not available. Carcass weight is defined as ex abattoir (i.e. bone in). Owing to diverse cutting practices by butchers and the difficulty in clearly defining 'retail weight of meat' it is considered impractical to derive a factor for the purpose of expressing estimated meat consumption in terms of retail weight. (Estimates of retail weight as a percentage of carcass weight range from 70 per cent for beef, 80 to 85 per cent for lamb and 80 per cent for pork.)

**APPARENT CONSUMPTION OF MEAT AND MEAT PRODUCTS AS HUMAN FOOD**

| <i>Year</i>              | <i>Beef and<br/>veal</i> | <i>Mutton</i> | <i>Lamb</i> | <i>Pigmeat<br/>(a)</i> | <i>Offal</i> | <i>Total<br/>meat</i> | <i>Poultry<br/>meat</i> |

(a) Includes pigmeat products such as bacon and ham.

NOTE: Beef, veal, mutton, lamb, pigmeat and offal are expressed in terms of carcass weight, and poultry meat in dressed weight.

For further details on meat production and slaughtering see the following publications: *Livestock and Livestock Products, Australia* (7221.0), *Value of Agricultural Commodities Produced, Australia* (7503.0) and *Apparent Consumption of Foodstuffs and Nutrients, Australia* (4306.0).

### Australia Meat and Livestock Corporation

Legislation was enacted to establish the Australian Meat and Livestock Corporation (AMLC) from 1 December 1977. The Corporation, which regulates and promotes the export of both meat and livestock and the promotion of domestic consumption, replaced the Australian Meat Board.

In mid-1984 the Australian Government introduced measures to restructure the administration of the Australian livestock and meat industry. Legislation enacted at the time, or foreshadowed, had three primary components:

- a restructured AMLC;
- establishment of the Australian Meat & Livestock Industry Policy Council (AMLIPC);
- the foreshadowed replacement of the Australian Meat Research Committee (AMRC)

with an incorporated body called the Australian Meat and Livestock Research and Development Corporation (AMLRDC).

The AMLC has the power to trade in meat and livestock in a manner which accords with adopted policy and with normal commercial practice. Its power is also extended to engaging in sole trading or to permitting restricted trading by a specified holder or holders of meat or livestock licences. The exercise of this sole or restricted trading power is limited to circumstances where: a monopoly buying power is, in the AMLC's opinion, distorting normal market forces; such action is necessary or desirable to ensure that producers receive a fair return for the meat or livestock exported to that market; the exercise of sole trading powers would be beneficial for the development or further development of that market; the exercise of sole trading powers would be in the best commercial interests of the industry.

In order to foster consultation, the AMLC may, for the purposes of considering any matter relating to the performance of its functions, make arrangements for consulting persons and bodies representative of different sectors of the industry.

The AMLC's main functions are to:

- improve the production of meat and livestock in Australia;
- encourage and promote the consumption and sale of Australian meat, and the sale of Australian livestock, both in Australia and overseas;
- encourage, assist, promote and control the export of meat and livestock from Australia.

Exporters of meat and livestock are licenced by the AMLC and have to comply with its requirements in relation to export trading. The AMLC assists exporters in overseas market development and conducts meat promotion activities in Australia and abroad. It has authority also, to perform a wide range of other functions aimed at improving the production of meat and livestock for the general benefit of the meat and livestock industry.

Two bodies have been established within AMLC to undertake major programs for the meat and livestock industry. These are the Authority for Uniform Specification of Meat and Livestock (AUSMEAT), which is developing and implementing a meat and livestock description language, and Computer Aided Livestock Marketing (CALM) which is conducting livestock sales by computer.

### **Australian Meat and Livestock Industry Policy Council**

The legislation referred to above established a new statutory body, the AMLIPC, to relieve the AMLC of responsibility for the examination of all broad industry policy issues. It is intended that AMLIPC:

- facilitate the participation of industry in the development and formulation of industry policies;
- provide a forum of consensus, building between different sectoral interests within the industry;
- provide opportunities, through AMLIPC Working Groups, for all interested parties to work together on the factual examination of industry problems, and to present practical proposals to government for their solution.

## **Wool**

The Australian Sheep Flock contains nearly 20 per cent of the world's sheep, and produces over 28 per cent of the total annual production of wool. Approximately 75 per cent of the Australian Flock are of a single breed, the Merino, raised primarily for its heavy fleeces of fine quality wool.

### **Wool production**

Wool as shorn from the sheep ('greasy wool') contains an appreciable amount of grease, dirt, vegetable matter and other extraneous material other than the clean wool fibre. The exact quantities of these impurities in the fleece vary between countries, differing climatic and pastoral conditions, with seasonal fluctuations and with the breed and condition of the sheep. It is, however, the clean wool fibre that is ultimately consumed by the textile industry and the term 'clean yield' is used to express the net wool fibre content present in greasy wool.

Since the 1946-47 season, the average clean yield of Australian wool has been assessed annually. In the early years, the average clean yield was assessed on the basis of a small number of tests and subjective appraisal. However, in recent years the Australian Wool Corporation has calculated the clip average yield on the basis of laboratory tests of yield applied to nearly all wool offered for sale at auction in Australia. It was 64.31 per cent in 1985-86.

Wool scoured and carbonised in Australia before export, however, has a somewhat lower clean yield than the whole clip, because much of the greasy wool treated locally for export in this form is dirty, low-grade wool. The quantity of scoured and carbonised wool exported during 1985-86 was about 16 per cent of total raw wool exports in greasy terms. For the clean yield of Australian scoured wools exported, a standard factor of 93 per cent has been adopted.

The following table shows details of total wool (i.e. shorn, dead, fellmongered and exported on skins) as well as the numbers of animals shorn, the average fleece weight and the gross value of the wool.

### SHEARING, WOOL PRODUCTION AND VALUE

| Year    | Wool production       |                       |             |               | Total wool  |             |
|---------|-----------------------|-----------------------|-------------|---------------|-------------|-------------|
|         | Sheep and lambs shorn | Average fleece weight | Shorn wool  | Other wool(a) | Quantity    | Gross value |
|         |                       |                       |             |               | '000 tonnes | '000 tonnes |
|         | million               | kg                    | '000 tonnes | '000 tonnes   | '000 tonnes | \$m         |
| 1980-81 | 150.0                 | 4.25                  | 637.9       | 62.3          | 700.1       | 1,670       |
| 1981-82 | 155.2                 | 4.26                  | 661.0       | 56.2          | 717.2       | 1,789       |
| 1982-83 | 149.1                 | 4.30                  | 641.5       | 60.2          | 701.7       | 1,761       |
| 1983-84 | 152.6                 | 4.40                  | 671.2       | 56.4          | 727.6       | 2,016       |
| 1984-85 | 168.2                 | 4.48                  | 752.7       | 61.6          | 814.3       | 2,434       |
| 1985-86 | 173.8                 | 4.39                  | 762.1       | 67.4          | 829.5       | 2,707       |

(a) Comprises dead and fellmongered wool, and wool exported on skins. (b) Gross value is based, for shorn wool, upon the average price realised for greasy wool sold at auction and, for skin wools, on prices recorded by fellmongers and skin exporters.

### The wool market

The primary raw wool market in Australia is at public auctions where brokers receive wool into store and then acting on the growers' behalf arrange sampling for valuation and for laboratory measurement of the main, variable physical characteristics and then offer the wool for sale at a rostered auction. Some 80 per cent or more of the clip is normally marketed this way. The remainder is sold privately at transaction prices agreed between the grower and a buyer.

The Australian Wool Corporation, on behalf of all growers, operates a minimum price support scheme at public auction sales.

### Wool receipts

#### TAXABLE WOOL RECEIVALS

| Year    | Receipts        |            |                     | Dealers as per cent of total receipts | Shorn wool production(b) |
|---------|-----------------|------------|---------------------|---------------------------------------|--------------------------|
|         | Brokers (NCWSB) | Dealers(a) | Brokers and dealers |                                       |                          |
|         | —'000 tonnes—   |            |                     | per cent                              | '000 tonnes              |

(a) Includes brokers who are not members of the National Council of Wool Selling Brokers of Australia (NCWSB). (b) Obtained from the annual Agricultural Census.

Under the terms of the Wool Tax Acts, all growers pay a tax on the gross value of shorn wool sales, to provide financial backing for wool promotion, research and the operation of a statutory Reserve Price Scheme. The ABS collects details of the total amounts of taxable wool received by wool selling brokers and dealers each year. These figures exclude wool received by brokers on which tax had already been paid by other dealers (private buyers) or brokers.

### **Wool marketing arrangements**

The Australian Wool Corporation is a Commonwealth statutory authority, established at the request of the nation's woolgrowers to undertake a number of functions on their behalf, principally to stimulate the demand for Australian wool. Most important of these functions is a Reserve Price Scheme in the raw wool market, and comprehensive global wool promotion programs.

The Reserve Price Scheme was introduced to the market in 1970 and seeks to provide a measure of wool price stability, in Australian dollar terms, to the benefit of the industry.

At the commencement of each season a Minimum Price for each wool type is established, and published, to apply for the entirety of that season (financial year). Any wool which fails to attract bids equal to or higher than this minimum is purchased by the Corporation at that price and held by the Corporation until demand improves. As well, when the market is trading above floor price levels, the Corporation may intervene in the market with the aim of providing market stability. This may be needed, for instance, when there is uncertainty about exchange rates or when the market enters a cycle of volatile price change.

Finance for the operation of the Reserve Price Scheme is provided by growers, through a compulsory Wool Tax. The Australian Wool Corporation has a number of other responsibilities which include supervision of the industry's comprehensive research programs, establishing, monitoring and when necessary enforcing industry agreed clip preparation standards, shearer training and encouraging efficiency within the sphere of wool handling and transport. It also operates extensive commercial storage facilities on the industry's behalf.

### **Wool testing**

The Australian Wool Testing Authority came into existence in 1957 but its role became more prominent with the introduction, in 1971, of wool valuation techniques relying on objective specification of wool's main physical characteristics. From the first sales of wool in this manner in the early 1970s, this technique has achieved universal acceptance and now 99 per cent of all wool sold at auction is accompanied by certified measurements for yield, (i.e. the amount of clean wool fibre), average fibre diameter and the percentage and type of vegetable fault.

During the 1986-87 season, commercial testing commenced for the additional characteristics of staple length and strength. Adoption of these new measurements will be a necessary prelude to further marketing innovations including the possible sale of wool solely on the basis of measurement and description.

At the direction of the Commonwealth Government, the Authority, which had operated as a division of the Corporation, was transferred to the private sector effective from the beginning of July 1982. The new company is known as AWTA Ltd.

### **Wool promotion**

Since 97 per cent of the Australian wool clip is exported, the other major arm of wool marketing is the demand stimulating activities carried out in manufacturing and consumer markets around the world. These programs, which commenced in 1937, were significantly scaled up in the 1960s in response to the challenge posed by synthetic fibres. In more recent times, these programs have again been increased in an effort to ensure wool's future as a preferred textile fibre in the world's major consumer markets. Growers have financed wool promotion since its inception, and currently do so at the rate of 4 per cent of their gross wool sales revenue. This is boosted by a Commonwealth Government contribution equal to 1.2 per cent of gross wool sales revenue, and in 1986-87 these contributions totalled \$147 million. The majority of these funds are remitted to the International Wool Secretariat which operates actively in more than 50 countries around the world.

## Wool research

Australian woolgrowers have financed industry research programs since 1937. In recent times this was co-ordinated through the Wool Research Trust Fund to which both the woolgrowers and the Commonwealth Government contributed. The Fund was administered by the Commonwealth Department of Primary Industries and Energy.

From 1 July 1986, the task of determining industry research priorities and allocating funds was transferred to a new body, the Wool Research & Development Council which was constituted as a committee of the Australian Wool Corporation.

Major recipients of wool industry research funds include the Commonwealth Scientific and Industrial Research Organisation (CSIRO)—especially in the fields of wool textile research; the Australian Bureau of Agricultural and Resource Economics; universities and States' departments of agriculture primary industry.

## Wool income

Fluctuations in wool prices have a marked effect on agricultural and national income. In 1945-46 the gross value of wool production was \$117.2 million, representing 17.4 per cent of the gross value of all agricultural commodities produced, while in 1950-51, when prices reached a peak during the Korean War, wool was valued at \$1,303.8 million, or 55.6 per cent of total agricultural industries. More recent figures for the contribution of wool income to total agricultural production and national exports reflect the growth in other commodities over the intervening years, rather than a decline in the fortunes of the wool industry.

### WOOL INCOME (per cent)

| <i>Year</i>       | <i>Value of wool<br/>as a per cent<br/>of total<br/>agriculture</i> | <i>Value of wool<br/>exports as a<br/>per cent of total<br/>Australian<br/>exports</i> |
|-------------------|---------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| 1980-81 . . . . . | 14.4                                                                | 10.2                                                                                   |
| 1981-82 . . . . . | 14.1                                                                | 10.2                                                                                   |
| 1982-83 . . . . . | 15.0                                                                | 8.5                                                                                    |
| 1983-84 . . . . . | 13.1                                                                | 8.7                                                                                    |
| 1984-85 . . . . . | 15.8                                                                | 8.7                                                                                    |
| 1985-86 . . . . . | 17.6                                                                | 7.3                                                                                    |

The gradual strengthening of wool prices since the mid-1970s has seen wool's contribution to total national export revenue increase steadily and in the years since 1983-84 has almost doubled to almost \$4,000 million in 1986-87. This makes wool Australia's largest primary industry export earner and second only to coal on the list of national export industries.

## Stocks

Stocks shown below of raw and semi-processed wool were held by wool processors, scourers, fellmongers, brokers, dealers and the Australian Wool Corporation. They exclude wool on skins since this wool is not recorded as production until fellmongered in Australia or exported on skins.

## Wool processing

Approximately 85 per cent of all wool passing through the Australian auction system comprises combing fleece and oddment types which are ultimately processed on the worsted system. The remaining 15 per cent, being the shorter or carding wools such as locks, crutchings, and lambs wool, is directed to the woollen system. This latter group is boosted some 5–10 per cent by noils combed out during worsted processing.

At present about two-thirds of total carding types produced are processed in Australia, though recent expansion in carbonising capacity in Taiwan and Japan has introduced a new element to this section of the market.

During the 1970s there was a trend to increased early stage processing of Australian wool before export. Recently, however, early stage processing has stabilised at around 18 per cent of wool production. Over 95 per cent of total Australian wool production ultimately enters international trade.

The main scope for expanded domestic processing remains with worsted types for export in scoured or combed top form. Japanese processors initiated the export of scoured worsted types from Australia, and Japan became Australia's major export market for scoured wool in 1973–74.

Before 1975 the wool processing industry was largely centralised in cities close to major ports. Since then, however, a general trend towards decentralised, inland locations has occurred.

## Wool consumption

Two series of calculations on Australian wool consumption are shown below.

- Consumption of raw wool, which measures consumption in terms of scoured wool used by mills.
- Consumption of processed wool, which is calculated from the usage of woollen and worsted yarn.

Raw wool comprises greasy, slipe, scoured and carbonised wool. This series has been included for comparison purposes with other countries.

## CONSUMPTION OF RAW AND PROCESSED WOOL

('000 tonnes)

| Year              | Consumption of processed wool |       |                      |       |                      |       |        |       |
|-------------------|-------------------------------|-------|----------------------|-------|----------------------|-------|--------|-------|
|                   | Consumption of raw wool       |       | Worsted yarn used(a) |       | Woollen yarn used(b) |       | Total  |       |
|                   | Greasy                        | Clean | Greasy               | Clean | Greasy               | Clean | Greasy | Clean |
| 1980–81 . . . . . | 51.9                          | 31.0  | 9.4                  | 5.5   | 14.5                 | 8.9   | 25.0   | 14.9  |
| 1981–82 . . . . . | 55.5                          | 33.1  | 8.6                  | 5.1   | 15.3                 | 9.5   | 25.1   | 15.1  |
| 1982–83 . . . . . | 54.7                          | 32.7  | 9.8                  | 5.8   | 13.1                 | 8.2   | 24.1   | 14.5  |
| 1983–84 . . . . . | 54.4                          | 32.4  | 9.8                  | 5.7   | 14.4                 | 8.9   | 25.5   | 15.2  |
| 1984–85 . . . . . | 59.3                          | 35.4  | 10.7                 | 6.3   | 17.0                 | 10.6  | 28.9   | 17.4  |
| 1985–86 . . . . . | 62.5                          | 37.3  | 10.5                 | 6.1   | 18.3                 | 11.4  | 29.9   | 18.1  |

(a) Wool content of yarns containing a mixture of wool and other fibres.

(b) Comprises pure and mixed woollen yarn.

The second series is considered to be a more satisfactory measure of Australian wool consumption, principally because allowance is made for significant quantities of wool tops exported. However, both series relate to consumption of wool by the wool textile industry, and should not be used as measures of consumption of wool at retail level. It has not been possible to estimate wool consumption at retail level because of the impracticability of obtaining reliable data concerning the wool content of the multiplicity of woollen and worsted piece-goods.

## Exports of wool

From its earliest days the Australian wool industry has been export oriented, and today approximately 95 per cent of total annual production of wool is exported.

The great bulk of this leaves the country in its natural 'greasy' state, but increasing quantities are being exported in part processed forms (i.e. scoured, carbonised, top and noil) and as wool on skins.

### EXPORTS OF WOOL

| Year    | Selected exports ('000 tonnes: greasy basis) |                           |                      | Total exports       |              |
|---------|----------------------------------------------|---------------------------|----------------------|---------------------|--------------|
|         | Greasy and<br>slipe                          | Scoured and<br>carbonised | Exported on<br>skins | Greasy basis<br>(a) | Value f.o.b. |
|         |                                              |                           |                      | '000 tonnes         | \$m          |
| 1980-81 | 531.7                                        | 101.9                     | 57.0                 | 714.8               | 1,931        |
| 1981-82 | 497.6                                        | 93.0                      | 50.6                 | 667.9               | 1,913        |
| 1982-83 | 487.7                                        | 82.0                      | 54.2                 | 653.6               | 1,881        |
| 1983-84 | 497.7                                        | 95.7                      | 50.7                 | 669.8               | 2,049        |
| 1984-85 | 554.9                                        | 108.5                     | 55.4                 | 746.8               | 2,548        |
| 1985-86 | 607.9                                        | 130.4                     | 61.2                 | 830.5               | 3,098        |

(a) Includes processed wool.

For further details on sheep shorn, wool production and overseas trade see the following publications: *Livestock and Livestock Products, Australia* (7221.0), *Sheep Numbers, Shearing and Wool Production Forecast, Australia* (7211.0), *Shearing and Wool Production Forecast, Australia (Preliminary)* (7210.0), *Livestock Products, Australia* (7215.0), *Foreign Trade, Australia* (5409.0, 5410.0), *Production Bulletin No. 4: Australia* (8360.0) and *Value of Agricultural Commodities Produced, Australia* (7503.0).

## Dairying

Dairying in Australia has experienced quite significant changes in recent decades. In response to changed demand patterns and consumer preference, both in Australia and overseas, there have been dramatic changes in cow numbers, farm productivity, product mix, export levels and major export destinations.

Although dairying occurs in all States, Victoria, Tasmania and New South Wales combined account for 80 per cent of total milk production. In recent years there has been structural adjustment in some States to match production with domestic market demand—particularly liquid milk demand. With the exception of some inland irrigation areas, e.g. the Goulburn/Murray Valley and the M.I.A., most dairying is centred along the coastal belt. Some feed lot dairies have been established in Australia.

## Production

Wholemilk production has been around 6,000 million litres in more recent years with Victoria representing approximately 60 per cent. Although total production has stabilised, this has been associated with a fall in both cow numbers and the number of registered dairy farms. In 1985-86 there were some 18,500 registered dairy farms with 1,776,000 cows in production. This compares with 1982 figures showing some 20,300 farms and 1,812,000 cows.

The factors behind the yield gains of about 4 per cent per annum since 1982 include improved feeding programs (pasture and supplementary), genetic/breeding gains and generally enhanced farm management practices. Economy of operation gains have been possible as average farm and herd size has increased. This has enabled more economic application of new technology.

There has also been change within the processing sector, reflecting adjustments to relative prices. Persistent world stockpiles of butter have depressed export prices over recent years. As a result there has been a marked swing away from butter production to cheese and wholemilk powder production. Associated with falling butter production has been a fall in skim milk powder production. New technology, e.g. short method cheese production and ultra filtration, is enabling the processing sector to improve its relative competitiveness. Recent amalgamations within the processing sector should enable further competitive gains.

### Domestic market

The consumption of dairy products in Australia has undergone change in recent years in both the volume and composition of dairy product consumption. These changes generally reflect changes within the Australian population as Australia becomes more culturally diverse. Other factors influencing dairy food consumption include changed consumer preference, e.g. more diet/health conscious, and changed relative prices (butter with respect to margarine). Liquid milk sales account for around 27 per cent of total milk production and compete heavily against other non-alcoholic beverages, e.g. fruit juices. Changes in manufactured dairy produce consumption have been more dramatic than for liquid milk. Recent product developments such as spreadable butter and butter/vegetable oil blends have been commercialised with reasonable success.

Since 1960 annual per capita cheese consumption has risen by an average of 7.9 per cent with current levels at around 8.4 kilograms. The area of greatest growth has been in the specialty type cheeses while per capita consumption of traditional cheddar type cheeses has stabilised at around 4.5 kilograms per annum. The cheeses to have experienced quite large increases include Camembert, Mozzarella and Parmesan.

Recent figures indicate a slight trend towards locally produced cheese at the expense of imported product—particularly from the E.E.C. This trend towards local product reflects international currency movements and a more responsive local processing sector. Smaller, sometimes on-farm, cheese plants have been recently established in response to this consumer trend towards the specialty type cheeses.

### MILK CATTLE NUMBERS

(a) One year and over, kept for the establishment's own milk supply.

### International marketing

During 1986-87, Australia exported dairy product to the value of \$466m (f.o.b.). In value terms, the main exports were cheese and milk powders, especially skim and whole milk. Given changes in the international marketing environment—especially the E.E.C.—the direction of Australian dairy product exports has changed significantly over recent years.

World market price minima for dairy products are established under the General Agreement on Tariffs and Trade (GATT). The minima are determined after consultation with relevant signatory nations. However, given over-supply of some dairy products there has been an incentive to sell product on the world market at below GATT minimum prices.

### Government assistance

New institutional market arrangements in the Australian dairy industry were introduced on 1 July 1986. This scheme was developed after much industry consultation and replaced an equalisation scheme which aimed to protect the industry from unexpected and sharp falls in market prices. Central to the former scheme was that returns on export markets were pooled and manufacturers received an equalised return.

Under the current scheme there is to be no equalising of returns and, as such, individual manufacturer performance may be reflected in farm gate returns. The general thrust of the new arrangements are to further expose the industry to market forces, both locally and overseas. An integral part of the current arrangements is the operation of the Market Support Payments and the Supplementary Support Payment funds. These funds aim to support export market returns.

The Market Support Payments Fund is financed via an all milk levy which is determined by government following recommendation of the Australian Dairy Corporation. The all milk levy for 1986-87 was set at 35c/kg milkfat, current legislation prevents the levy exceeding 45c/kg milkfat.

The Supplementary Support Payment Scheme was established to cover the transition from the former underwriting/equalisation scheme to the current arrangements. Product levies are payable on all domestic sales of butter and certain cheese varieties. Assistance to industry is also offered via the Rural Adjustment Scheme which provides financial assistance for such things as farm build-up, farm-improvement and household support. Government funding of dairy research is provided on a dollar for dollar matching basis with industry funded contributions. Producers at present pay a 2.5 cents/kg milkfat levy for research and a 5.5 cents/kg milkfat levy for promotion.

The allocation of research funds is administered through the Dairy Research Council. Dairy Research Council supported research covers three broad areas—farm, manufacturing, and economics and marketing. Examples of more specific research include promotion effectiveness, cheese making technology, pasture renovation, animal nutrition and distribution.

#### PRODUCTION, UTILISATION AND GROSS VALUE OF WHOLE MILK

| Year    | <i>Whole milk intake by factories (a)</i> |                                                       |                     |         | Gross value<br>\$ million |
|---------|-------------------------------------------|-------------------------------------------------------|---------------------|---------|---------------------------|
|         | <i>Market milk sales by factories</i>     | <i>Milk used in the manufacture of dairy products</i> | <i>Total intake</i> |         |                           |
|         | —million litres—                          |                                                       |                     |         |                           |
| 1980-81 | 1,540                                     | 3,703                                                 | 5,243               | 885.1   |                           |

| 1982-83 | 1,573                                     | 3,951                                                 | 5,524               | 1,186.5 |                           |
| 1983-84 | 1,572                                     | 4,351                                                 | 5,923               | 1,153.2 |                           |
| 1984-85 | 1,593                                     | 4,445                                                 | 6,038               | 1,035.4 |                           |
| 1985-86 | 1,625                                     | 4,412                                                 | 6,037               | 1,106.7 |                           |

(a) These milk intake figures have been collected (from milk factories) by the Australian Dairy Corporation and replace statistics of whole milk production and utilisation previously compiled by ABS.

#### Industry outlook

The short-term future of the Australian dairy industry is very dependent on future developments within the international trading environment. Stocks of butter are still relatively high, and future world prices will obviously reflect changes to these stock levels. While measures have been implemented in the E.E.C. and the U.S.A. to restrict milk production they have had no significant impact.

At present, trade between Australia and New Zealand is covered by a Memorandum of Understanding. This aims to ensure that there is close liaison between the two countries on matters such as third markets, respective domestic issues regarding production, pricing etc., and access to each country's market. Currently, sales growth of New Zealand is restricted to growth in the total Australian market. Access is currently set at approximately a 5 per cent share of the Australian cheese market. However under the terms of the Australia-New Zealand Closer Economic Trade Agreement (CER), trade between the two countries is to be unrestricted by 1995. There will be a review of the CER agreement during 1988 and, the future of the dairy industry will depend, in part, on future negotiations and trade with New Zealand.

While the international market heavily influences the Australian dairy industry, so too does the domestic market. It is possible that the national liquid milk market may be less controlled in the future. This possibility, together with changing consumer preferences provides the Australian dairy industry with significant challenges.

**PRODUCTION AND TRADE OF BUTTER AND CHEESE**

| Year    | Butter             |             |              | Cheese                |             |              | Imports     |

For further details on the dairying industry see the publications, *Livestock and Livestock Products, Australia* (7221.0), and *Production Bulletin No. 3: Food, Drink and Tobacco, Australia* (8359.0).

**Beekeeping**

The beekeeping industry consists of approximately 300-400 full-time apiarists, who produce approximately 70 per cent of Australian honey, and a large number of part-time apiarists who produce the rest. Some of these apiarists move as far afield as from Victoria to Queensland in an endeavour to obtain a continuous supply of nectar for honey from suitable flora. While honey production remains the predominant sector of the industry, production of breeding stock and provision of pollination services is significant.

Exports of honey are regulated by the Australian Honey Board which also promotes honey consumption.

Statistics in the following table relate to apiarists with forty or more hives.

**BEEKEEPING STATISTICS**

| Year    | Number of apiarists | Number of beehives |       | Honey produced                         |             |             | Beeswax produced |             |
|---------|---------------------|--------------------|-------|----------------------------------------|-------------|-------------|------------------|-------------|
|         |                     | Productive         | Total | Average production per productive hive | Gross value | Gross value | Quantity         | Gross value |
|         |                     |                    |       |                                        |             |             |                  |             |
|         |                     | '000               | '000  | '000 tonnes                            | kg          | '000        | tonnes           | '000        |

| 1984-85 . . . . . | 17.5        | 16,480       | 390      | 1,589        |
| 1985-86 . . . . . | 14.6        | 16,724       | 292      | 1,352        |

## Honey levy

The *Honey Levy Acts (Nos. 1 & 2) 1962* impose a levy on domestic sales of honey. The rate of levy is set by regulation up to a maximum of 2.70c per kg fixed by the legislation.

The *Honey Export Charge Act 1973*, imposes a charge on exports of honey. The legislation provides for a maximum charge of 1.5c per kg.

For further information, see the publication *Livestock and Livestock Products, Australia (7221.0)*.

## Eggs and egg products

Commercial egg production in Australian States (incl. N.T. but excl. A.C.T.) in 1985-86 was about 183.1 million dozen. The decrease of recent years is expected to continue as all States endeavour to reach their goal of maintaining quota hen numbers at such levels as will result in production being very close to domestic needs with very little left over for export. Such action has been taken as the net return on exports of shell eggs and egg products has been well below the cost of production in past years.

## EGGS AND EGG CONSUMPTION

(million dozen)

| Year              | Recorded Commercial production | Exports (a) | Apparent consumption in Australia as human food |                             |
|-------------------|--------------------------------|-------------|-------------------------------------------------|-----------------------------|
|                   |                                |             | Total                                           | Per capita (number) of eggs |
| 1983-84 . . . . . | 197.5                          | 20.1        | 180.0                                           | 140                         |
| 1984-85 . . . . . | 185.8                          | 6.3         | 178.6                                           | 137                         |
| 1985-86 . . . . . | 183.1                          | 7.6         | 177.4                                           | 134                         |

(a) Includes shell eggs and egg products in shell egg equivalent.

## Exports

The Australian Egg Board, established by Commonwealth legislation in 1947, was responsible for co-ordinating export marketing arrangements. It was empowered to purchase surplus domestic supplies from State marketing authorities, if they so wished, and to arrange to sell such eggs or products on overseas markets.

## EXPORTS OF EGGS AND EGG PRODUCTS

| Year              | Eggs in shell |              | Eggs not in shell |              |          |              |
|-------------------|---------------|--------------|-------------------|--------------|----------|--------------|
|                   |               |              | Liquid form       |              | Dry      |              |
|                   | Quantity      | Value f.o.b. | Quantity          | Value f.o.b. | Quantity | Value f.o.b. |
|                   | '000 doz      | \$'000       | tonnes            | \$'000       | tonnes   | \$'000       |
| 1980-81 . . . . . | 1,423         | 1,113        | 8,508             | 8,891        | 50       | 337          |

| 1985-86 . . . . . | 2,321         | 2,013        | 2,315             | 2,743        | 129      | 652          |

Following reviews of the Board's operations, in the light of falling export quantities resulting from industry actions to reduce surplus production, the Commonwealth Government announced in August 1984 its decision to abolish the Australian Egg Board. Legislation was enacted late in 1984 to abolish the Board.

Any export marketing is now undertaken by the individual State Board concerned under the aegis of an Exporters Committee established by the Australian Egg Marketing Council (AEMC). The AEMC is a non-statutory body whose membership is made up of the members of the State Egg Marketing Boards.

Exports are predominantly in egg pulp form—white, yolk and whole egg.

## Agricultural improvements

### Irrigation on agricultural establishments

Irrigation is one of the factors by which agriculture is developed. The variability in stream flow and annual rainfall means that successful irrigation of crops and pastures is dependent on storage. Ground water supplies are also used in areas where the quantity is adequate and the quality is suitable. The area of land irrigated (approximately 1.6 million hectares in 1983-84) forms about 9 per cent of the total area under crops and only 0.3 per cent of the total area of agricultural establishments.

Chapter 16, Water Resources, contains additional details of water conservation and irrigation with international, national and interstate aspects.

Irrigation statistics are collected every three years in the Agricultural Census and represent area actually irrigated. They were collected in the 1986-87 Census.

(b) Source is the Agricultural Census and represents area actually irrigated. (c) This source represents irrigation water which has come from either surface or underground sources.

### Fertilisers

Most Australian soils are deficient in phosphorus. Because of this and the significant but less widespread deficiency of sulfur in many soils, phosphatic fertilisers, particularly single superphosphate, account for the bulk of fertiliser usage. Nitrogen deficiency is also general in Australian soils and the use of nitrogenous fertilisers is increasing. Potassium deficiency however is confined mainly to soils in the higher rainfall areas which are intensively cropped or used for irrigated pastures.

The pattern of fertiliser usage in Australia has changed dramatically in recent years. Prior to 1973-74 the usual consumption ratio of elemental N:P:K has been 2:6:1, but by 1983 the ratio had changed to almost 3:3:1. This variation has resulted from a combination of reduced consumption of phosphatic fertilisers with an increased consumption of nitrogenous fertilisers.

The domestic industry has sufficient manufacturing capacity to meet normal local demand for phosphatic fertilisers but not nitrogenous fertilisers. Australia is dependent on imports of potassic fertilisers, rock phosphate and sulfur. Imports of compounded high analysis fertilisers and specialised fertilisers were insignificant until 1982-83. Since then, however, imports have been rising strongly, largely as a result of oversupply and lower prices on the world market.

## ARTIFICIAL FERTILISERS: AREA AND USAGE

| Year    | Area fertilised | Super-phosphate used | Nitrogenous fertilisers used | Other fertilisers used |
|---------|-----------------|----------------------|------------------------------|------------------------|
|         | '000 ha         | '000 tonnes          | '000 tonnes                  | '000 tonnes            |
| 1980-81 | n.a.            | 2,947                | 392                          | 609                    |
| 1981-82 | 26,777          | 2,873                | 395                          | 599                    |
| 1982-83 | n.a.            | 2,562                | 429                          | 633                    |
| 1983-84 | n.a.            | 2,481                | 414                          | 721                    |
| 1984-85 | 26,407          | 2,374                | 421                          | 885                    |
| 1985-86 | 25,089          | 2,160                | 408                          | 869                    |

Since the Second World War there has been a great expansion of the area of sown pasture accompanied by an increased use of fertilisers. New pasture varieties (including tropical species) have been developed, and nutrient or trace elements deficiencies in soils identified.

The main artificial fertiliser used in Australia is superphosphate, over half of which is used on pastures, mainly in areas with moderate to good rainfall. Large quantities are also used on cereal crops.

## SUPERPHOSPHATE USAGE

| Year                              | Selected crops and pastures |         |       |               |            | Total  |
|-----------------------------------|-----------------------------|---------|-------|---------------|------------|--------|
|                                   | Sown and native pastures    | Lucerne | Wheat | Other cereals | Sugar cane |        |

**Agricultural machinery on agricultural establishments**

Statistics on the type of agricultural machinery on agricultural establishments were published in early issues of the *Year Book*. Additional information was published in the publication *Agricultural Land Use, Improvements and Labour, Australia, 1980-81* (7103.0). Details of the sales of new tractors for agricultural purposes are given in the quarterly publication *Sales and Stocks of New Tractors, Australia* (8507.0).

**Employment in agriculture**

**Employment on agricultural establishments**

Prior to 1976, data on employment collected at the annual Agricultural Census differentiated between permanent full-time employees and temporary employees. Full-time workers excluded casual or seasonal workers and other persons working only part-time. Casual or seasonal workers were shown as temporary employees.

In the past it has been difficult to maintain comparability of employment on agricultural establishments from year to year because of the changing number of lessees and share farmers and because of the tendency of many farmers to include part-time family helpers as full-time workers in their returns. Since World War II there has been a decline in the percentage of people living in rural areas due, in part, to a rising standard of living accompanying the introduction of new techniques and increasing use of capital equipment, fuel, fertilisers, and pesticides. As a result, a smaller agricultural labour force is now producing a larger output of farm products.

**Regulation of Australian agricultural industries**

*Year Book* No. 61, pages 837-57, contains a summary of the means by which agricultural industries are assisted and regulated. It is not intended as a comprehensive statement of all the consultative and legislative assistance and control measures that exist, but rather as a description of the way in which these processes affect the crops, livestock and livestock products referred to earlier in this chapter.

## Agricultural research by CSIRO

Agricultural research, conducted by the Commonwealth Scientific and Industrial Research Organisation (CSIRO) is directed primarily to aspects of agricultural production that are of widespread significance and require mid to long-term research. It is aimed at establishing principles, practices and technologies that will improve the efficiency and long-term viability of Australian agriculture and its capacity to respond to changing needs. This work ranges from studies in basic biology to those designed to integrate new plant varieties, animal breeds and production technologies into sound production systems.

CSIRO's research is appropriate for attacking problems or developing opportunities that transcend State boundaries, are complex and require concentration of disciplinary effort for their solution, and may need sustained long-term effort before they yield practical results. CSIRO's agricultural research complements that of State government departments and universities, and the Organisation attaches considerable importance to collaborative research with them.

CSIRO's agricultural research makes up one-third of its overall research effort and covers the following research areas: plant improvement, plant physiology and biochemistry, soils and plant nutrition, crop and pasture pests and diseases, livestock production, livestock health, and agricultural systems. In addition, secondary industry research directly relevant to the agricultural industries covers wool textiles, food handling, processing and storage, and agricultural and veterinary chemicals. There is also research directly relevant to the agricultural industries carried out within the research area of environmental protection and rehabilitation.

Most of CSIRO's agricultural research is performed within the Institute of Animal and Food Sciences and the Institute of Biological Resources. The Institute of Animal and Food Sciences carries out scientific and technological research aimed at improving the efficiency of livestock production and the quality and safety of human foods. The Institute's activities include research on control of indigenous and exotic animal diseases; nutrition, reproduction, genetics and management of livestock; methods of processing, handling and storing meat, fish, dairy foods, fruit, vegetables and grain; and molecular and cellular biology and its application in the livestock and pharmaceutical industries. This research is performed by the following constituent units of the Institute—Divisions of Animal Health, Animal Production, Tropical Animal Science, Molecular Biology, Food Research, Australian Animal Health Laboratory and the Wheat Research Unit.

Research in the Institute of Biological Resources is directed to improvement of the productivity of Australia's rural industries and conservation of its biotic resources, recognising that the two are highly interdependent. Plants are sources of fibre and food, and the start of all human food chains. Research to optimise plant production is therefore of fundamental importance, and is directed to producing increased quantities of usable plant material of high quality and with least disruption to water resources, soils and fragile ecosystems. Work to increase plant productivity is complemented by research to improve our understanding of the Australian environment. This research is performed by the following constituent units of the Institute—Divisions of Plant Industry, Tropical Crops and Pastures, Horticultural Research, Soils, Water Resources Research, Wildlife and Rangelands Research, Entomology, and the Centre for Irrigation Research.

The Institute of Industrial Technology is also engaged in research of direct benefit to the agricultural industries. Wool textile and marketing research is performed by the Divisions of Protein Chemistry, Textile Physics, and Textile Industry, and research on the design and synthesis of potential agricultural chemicals is performed by the Division of Applied Organic Chemistry.

# CHANGING PATTERNS OF LAND USE IN AUSTRALIA

*(This special article has been contributed by the Division of Water and Land Resources, CSIRO—written by Dr P. Laut)*

## The land and its limitations

In terms of world agriculture, Australian agriculture is characterised by:

- its heavy dependence upon overseas markets;
- the large scale of activities compared with similar enterprises in other parts of the world;
- its heavy and long term concentration on a limited range of products;
- its dependence upon a low rainfall, seasonally dry and periodically droughty environment, and a geologically old land resource with limited fertility and relatively high propensity to degradation;
- the relatively high standard of living of the agricultural community.

The outstanding feature of Australian agriculture is its dependence upon overseas markets. As the Australian community consumes only a small part of the country's total agricultural production, most products must be sold in competition with other major producers, many of whom have large populations to help support their industries. Australian agriculturalists must therefore be economically efficient by world standards to compete on world markets.

A large part of the Australian continent is not particularly suited to agricultural production in comparison with the land resources of other major agricultural producers. This is mainly due to the seasonality and limited rainfall of the continent combined with very high rates of potential evaporation, and to prolonged droughts which periodically affect most parts of the Australian continent.

The vast interior of the Australian continent receives little rainfall in either winter or summer (less than 300 mm a year). This, combined with very high potential evaporation (in excess of 3,000 mm a year from a standard pan in which water is available at all times), means that in most years and in most seasons there is a soil moisture deficit. At best, this part of Australia may be used for extensive livestock grazing. As the northern portion of the continent receives almost all its rainfall (400–1,200 mm) during the hot summer months when evaporation is greatest (2,800–3,200 mm a year pan evaporation), it is less effective for plant growth than in the south of the continent. Generally, there is a severe dry period during the winter, with a consequent need for irrigation for any cropping. The exception is the very high rainfall 'sugar coast' of Queensland which receives more than 1,600 mm of rainfall and has less than 1,600 mm pan evaporation.

The southern portion of the continent receives most of its rainfall (400–1,200 mm) during the cooler winter months when pan evaporation is usually less than 1,600 mm a year. Consequently there is more soil moisture available for plant growth for a given amount of rainfall than in the north, especially during the wet winter season, when even relatively dry lands may be used to grow cereal crops. The eastern coastal zone receives more rainfall than most other parts of the continent (800–1,600 mm a year) and has relatively low pan evaporation (less than 1,600 mm a year). This rainfall occurs during all seasons giving a potential growing season longer than for most other parts of Australia. Because of the rugged terrain and cooler temperatures of the eastern highlands, land use is highly varied, ranging from wilderness to intensive cropping and horticulture.

The Australian climate is also well known for its periods of low rainfall or drought which severely reduce the production of crops and animal forage and expose soils to erosion. Between 1965 and 1980, almost all of southern Australia experienced drought conditions, i.e. received less than the 10 percentile long-term rainfall for between 30 per cent and 40 per cent of all months.

At the commencement of European settlement these broad climatic patterns and limitations were unknown. The range and seasonal variability of the continent's regional climates had to be learnt and appreciated, often by bitter experience. Over the past 150 years, cropping activities were often extended well beyond sensible climatic limits, occasionally causing such hardship and environmental damage that government decrees were enacted to

limit the geographical extent of cultivation. In South Australia, for example, Goyder's Line was defined in 1865, while in New South Wales the non-agricultural Western Division was designated in 1901.

Within those lands climatically suitable for agriculture, local areas of steeply sloping lands, or lands with particularly fragile soils impose further restrictions on the pattern of land use. In the past, there was very little appreciation of these limitations of the Australian land resource. Very steeply sloping lands were often cleared for grazing and, worse still, for cultivation which led to widespread and severe erosion in areas such as the Southern Tablelands of New South Wales. In the southern pastoral lands where shrub vegetation, 'saltbush' and 'bluebush' provided forage for sheep and cattle, lack of understanding of annual rates of shrub growth led to gross overstocking which, in conjunction with depredation of huge rabbit populations, precipitated very serious losses of vegetative cover and consequent serious soil erosion. Much of western New South Wales for example, which suffered from these depredations, has never fully recovered and sheep numbers today remain well below those at the turn of the century.

Limitations on land for agriculture may be defined in terms of land capability. Most States are now completing land capability mapping for their agricultural lands, assisting land users to avoid mistakes of the past. But land users are frequently unwilling or unable to change land use practices. Sometimes this is because of difficult economic circumstances; at other times it is because land users have little or no understanding of the long-term consequences of their activities.

Information on the harmful effects of certain land use practices has often been ignored with consequent serious long-term effects. Dry land salinity was observed and explained in terms of extensive clearing of native woodlands in Western Australian wheatlands in the mid-1920s, and Victoria in the early 1960s; rising water tables and salinity led to the abandonment of a number of early irrigation areas along the Murray River around the turn of the century; and the serious long-term consequences of rising water tables in the Murrumbidgee Irrigation Area have been known since the 1950s.

### **The historical development of Australian agriculture**

Australian agriculture has passed through the following five broad phases in its continuing evolution since 1788.

1. The earliest phase, from 1788 to around 1820, represents the subsistence period of the early colony.
2. The second phase, from 1820 to 1860, highlights the early export of agricultural commodities.
3. The third phase, from the early 1860s to around the turn of the century, includes the development of the continental pattern of land use.
4. The fourth phase, from 1900 to the 1950s, was a period of adjustment and consolidation.
5. The fifth phase, from the 1950s to the present, has been a period of secondary expansion.

#### **1. 1788-1820**

During this period, the colonists of New South Wales and Van Diemen's Land struggled to provide even basic food requirements. They were not always successful in the earlier years and chronic hunger was not uncommon. Lack of agricultural experience, capital equipment of the most rudimentary kinds and of draught animals were complemented by an unknown environment. Towards the end of this period the economic potential of sheep was beginning to be appreciated by Marsden, Macarthur and others, with irregular wool and tallow exports. Exploration, of what proved to be better and far more extensive pastoral lands west of the Dividing Range and the interior of Van Diemen's Land, began in this period. The most important cultivation lands were the Windsor, Parramatta and Liverpool districts near Sydney where wheat and maize were the major crops. Sheep and cattle grazing were concentrated in the Cumberland basin and the south-east of Van Diemen's Land.

#### **2. 1820-1860**

This phase was characterised by rapid expansion both of the pastoral industry across Australia and wheat cultivation along the gulf seaboard of South Australia. Elsewhere, grain cultivation stagnated for three reasons: transportation problems were considerable (there were few roads capable of supporting grain laden wagons between the newly settled lands and exporting ports); soils of the older settled areas showed alarming declines in fertility after three to five years of cropping; and wheat varieties particularly suited to the climates of the

colonies were not available. However, by the end of this period, draught animals were more plentiful, and manures provided some soil improvement; cultivation and harvesting techniques and machinery suitable for Australian conditions had been developed, for example the wheat stripper; and greater numbers of small farmers or 'dungarees' were turning to wheat cultivation both for export, and throughout the 1850s, to meet an increasing domestic demand.

This period includes three very important changes to the structure of the colonial economies: the cessation of convict transportation; the development of free settler colonies with varying policies for land pricing; and the start of the gold rushes which brought both population and economic wealth to Victoria and New South Wales and later to other colonies. Each had profound effects on Australian colonial agriculture, varying from labour shortages and rapid regional increases in demand for foodstuffs, to long-term land marketing arrangements. By the end of 1860, the combined colonies possessed some 20 million sheep and 4 million cattle, and had almost half a million hectares under cultivation, half of which was wheat. At the end of this period, the broad pattern of Australian dryland agriculture was well towards the making.

FIGURE 1: SHEEP NUMBERS

### 3. 1860–1900

From the early 1860s to around the turn of the century the broad pattern of Australian land use was firmly established through the closer settlement Acts such as the Robertson Acts of New South Wales. In this period, a suitable land and water transportation system, was developed for the movement of agricultural products from source of production to the European and especially British markets. Australia became an important exporter of a wide range of agricultural products: wool, wheat, mutton, beef, fruit, sugar and dairy products.

Cattle numbers for the continent doubled in this period with increases of between nine- and ten-fold in Queensland and Western Australia. Sheep numbers increased three and a half times for all the colonies with a nine-fold increase in Western Australia and a six-fold increase in New South Wales (*see* Figure 1). The area cultivated increased around seven and a half-fold for all colonies between 1860 and 1900 with notable increases of over nine-fold in New South Wales and Queensland and over eight-fold in Victoria and Western Australia (*see* Figure 2). With the exceptions of Queensland and Tasmania, wheat sowings were responsible for most of the increases in cultivated area. In this period, New South Wales and Victoria increased their areas sown to wheat twelve-fold and South Australia and Western Australia, six-fold.

FIGURE 2: AREA CULTIVATED

### 4. 1900–1950

The broad geographic pattern of Australian agriculture did not alter radically during the first half of the twentieth century. The severe drought in eastern Australia which began in the last years of the nineteenth century continued into the new and, combined with the

rabbit plague, wreaked havoc on the agricultural economies of the eastern States. There were also notable regional droughts in the 1930s and 1940s and these, with the Great Depression and World War II, had severe impacts on the regional structure of agriculture, although not its geographical pattern. In particular, the economic depression and the droughts of the 1930s reduced many land holders to penury.

During the period 1900 to 1950, there were general agricultural adjustments in regions of harsher physical environments and livestock densities were permanently reduced throughout much of semi-arid Australia. At the same time there was a retreat from the drier margins of agricultural lands. But in all, this was a period of consolidation, based on the reconciliation of a relatively stable technology with a now reasonably well known environment. The two World Wars brought both benefits and problems. They reduced the supply of labour and capital for agriculture but increased the demand for its products. At the end of World War II there were large quantities of American ex-army equipment available which radically altered the level of mechanisation on Australian farms.

Despite setbacks from droughts, wars and economic depressions, national livestock numbers increased notably from 1900 to 1950, although not nearly as rapidly as in the previous period. Australian cattle numbers increased by 69% and sheep numbers by 60%. Only in the Northern Territory were these increases of the magnitude experienced elsewhere in Australia during the previous 40 years. Similarly, the area of cropland (predominantly sown to wheat) slightly more than doubled in this period.

In a 'dry' continent such as Australia, irrigation is often thought of as a major benefit and in this period State governments strongly supported the development of irrigation schemes. Towns such as Mildura and Griffith were established to service the needs of irrigation farmers and to process their products. By the end of this period the total of actual and planned irrigated land of all types comprised almost 3% of all Australia's crop and pasture lands.

#### **5. 1950-present**

This phase of Australian agriculture has involved some remarkable changes in world markets for agricultural products. These changes have precipitated major shifts in the structure and organisation of the agricultural economy. There have been considerable benefits from scientific research into problems of cropping and farm animal husbandry in this period. In particular, the introduction of myxomatosis devastated the immense Australian rabbit population and paved the way for significant increases in livestock numbers. The post-war economic boom and rural to urban migration facilitated widespread mechanisation, which in turn opened up large tracts of hitherto grazing lands in northern New South Wales, central eastern Queensland and southern Western Australia for cereal cultivation. War-time marketing restrictions on agricultural products led to more stable systems for their marketing. Road trucking for livestock helped reduce the impact of local and regional drought. In addition, there has been an expansion of irrigation areas especially for the cultivation of cotton and rice; introduction of a range of new crops such as oil seeds, and improved varieties to suit varying regional conditions; and a general intensification of land use throughout the higher rainfall areas of the southern and eastern portions of the continent.

There have been challenges also to 'traditional' agriculture as the rightful user of all possible lands, and to the right of the agriculturalist to ignore long-term ramifications of land use on the land resource. Conservation has become an important influence, both in the sense of improved management of the agricultural land resource to provide long-term sustainable yields, and in the sense of excluding agriculture from areas set aside for the preservation of native species. Urban development has also claimed notable areas of agricultural land along the margins of Australia's major cities for 'extensive' suburban or 'acreage' development and for recreation.

At the same time there have been considerable external pressures on Australian agriculture. Its traditional major market disappeared with Great Britain's entry into the European Economic Community which, because of the strongly supportive policies of that organisation, has now become a competitor with some of Australia's exports. To counter these losses Australian agriculture has had to turn to the U.S.S.R., Japan, and China to dispose of its products, and has had to adjust to meet their particular requirements.

This has also been a period in which the longer term degradation of the Australian land resource has been irrefutable as the results of long-term overstocking and poor cultivation techniques have been scientifically documented and publicly debated. The dryland salinity problem of Western Australian wheatlands and the rapidly increasing water tables of Murray-

Murrumbidgee irrigation areas are two such major issues confronting not only the agricultural community but the Australian community at large.

During the 1970s and 1980s Australian agriculture has been in a state of continuous flux with agriculturalists experimenting with new techniques and crops; varying the emphasis of their enterprises and gradually increasing the scale of their enterprises to spread the costs of specialised and expensive capital items such as auto-headers and four-wheel drive tractors.

The traditional indicators of Australian agricultural growth, numbers of cattle and sheep and areas of all crops and wheat, remain significant, despite the wide range of changes in the industry. In general over this period, sheep gave way to cattle with a peak in sheep numbers in 1970 and a huge increase in cattle numbers by 1976. Between 1950 and 1980 there was only a 16% increase in national sheep numbers compared to a 79% increase in cattle numbers.

In the same period, the areas sown to all crops and to wheat have grown steadily but consistently with only a 114% increase in cropland and a 125% increase in area sown to wheat. This suggests that with the present world market situation for agricultural products there may be little further increase in arable farming. While on the one hand farmers prefer to move between cropping and livestock as markets change, on the other they are often forced by economic circumstances to cultivate as much area as possible to cover the cost of their expensive cultivation and harvesting equipment. This has occurred to such an extent that many farmers in traditional wool-wheat mixed farming areas no longer follow rotations and have become wheat mono-cultivators. Wheat mono-cultivation, which requires much more precise management to maintain soil fertility and control diseases and weeds, places additional stresses on the Australian land resource, on farm management, and on land administration.

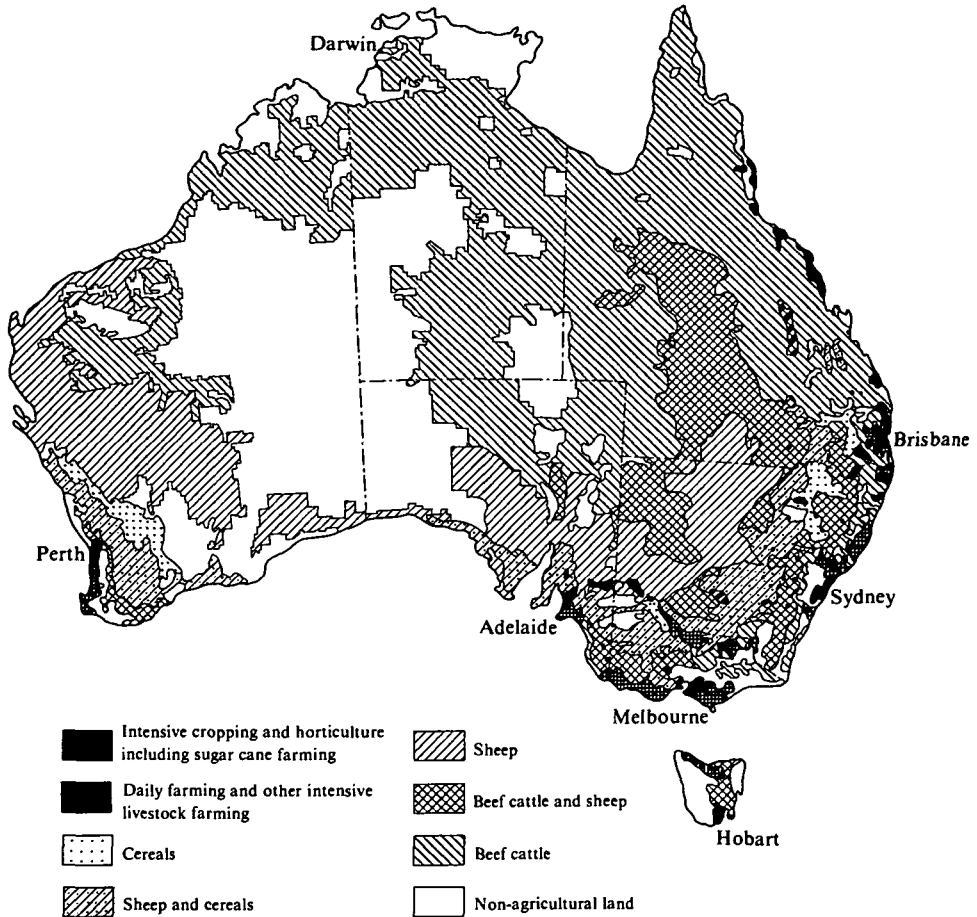

### **Agricultural land use in the 1980s**

In 1984-85 there were some 488 million hectares in agricultural enterprises in Australia. Only 4% of this area was cropped and 6% was under sown pastures and grasses. The remaining 90% remained under modified or unmodified native vegetation. The total area of agricultural land has remained approximately the same over the past decade. Two States, Western Australia and New South Wales, account for approximately 60% of Australia's cropped land but improved pastures are somewhat more evenly distributed amongst the States with New South Wales, Victoria and Western Australia accounting for 67% of the continent's total.

The area of individual establishments varies considerably according to types of activity. Vegetable growing farms or market gardens in Victoria and Tasmania vary from tens to hundreds of hectares, while cattle stations in the Northern Territory are commonly several hundred thousand hectares in extent. However, the mean size of agricultural establishments for each State is generally indicative of productivity of the land resource. The mean area of agricultural establishments for Australia for 1984-85 was 2,800 hectares, varying from 310 and 390 for Victorian and Tasmanian farms respectively, to 1,200 for New South Wales, 3,150 for South Australian, 4,600 for Queensland and 6,750 for Western Australian farms, with the cattle stations of the Northern Territory averaging an enormous 274,000 hectares.

The types and proportions of types of farming establishments also vary considerably from State to State. In 1984-85 Australia had approximately 173,100 agricultural establishments. In all States and the Northern Territory, livestock grazing dominates farming activities. Cereals cultivation and mixed cereals cultivation with sheep or beef cattle involves approximately 20-55% of all farms except in the Northern Territory. Most types of farming are widely spread among States (see Figure 3), and conversely most States have a wide range of farm types, with a few exceptions: sugar cane farms are almost exclusively in Queensland (91%) as are peanut farms (99%); tobacco farms are mostly in Queensland (59%) and Victoria (36%) and cotton farms in Queensland (45%) and New South Wales (55%). Agricultural establishments in the Northern Territory are almost exclusively beef cattle stations. Diversity of farm type by State, combined with a degree of flexibility in livestock and cropping components in southern Australia have proved advantageous in periods when one or two agricultural products receive low prices, but offer little advantage during periods of generally depressed agricultural markets.

FIGURE 3: FARM TYPES

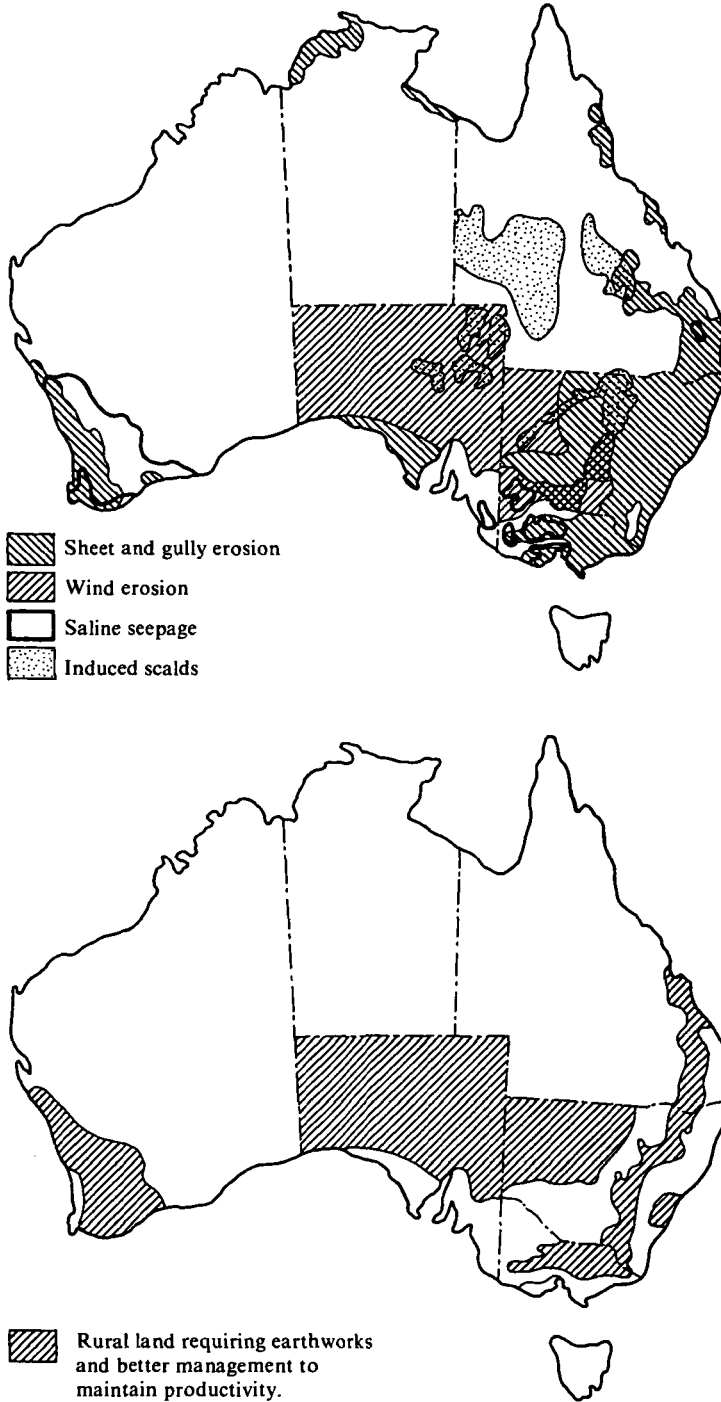

Source: *Atlas of Australian Resources, Third Series, Volume 3, Agriculture.*

The largest areas of irrigation occur in New South Wales and Victoria which include 41% and 34% of the continent's irrigated lands respectively. In New South Wales almost 60% of these irrigated areas are in State irrigation schemes (56% of irrigated area) and the emphasis has been on high value field and cereal crops such as cotton and rice. In Victoria, where there is also a heavy dependence on State irrigation schemes, emphasis has been on intensive livestock grazing (dairying and fat lambs) and horticulture (dried vine fruits). Queensland which has some 16% of the nation's irrigated lands depends heavily on underground water supplies and only 25% of the irrigated land receives its water from State irrigation schemes. Many of Australia's irrigation areas face serious problems of rising water tables because of the soils on which they were developed and water management techniques employed.

FIGURE 4: LAND DEGRADATION

Source: *Land Degradation in Australia*, L. E. Woods, AGPS, 1983.

---

### Australian agriculture in the coming decade

It seems likely that Australian agriculture will face a very competitive future with comparatively lower world prices for cereals and meats than have been experienced over the past two decades or so. It is doubtful whether this will markedly alter the structure of the industry or its geography, however it may accelerate trends towards larger and more economically efficient farming enterprises.

Perhaps the most worrying for the longer-term is the degradation of the land resource base of Australian agriculture. It is widely accepted that many of Australia's most productive agricultural lands are at risk to water erosion, wind erosion and salinity. Figure 4, adapted from a national survey of land degradation in the mid-1970s, indicates generally where these problems occur. Other forms of degradation also occur over much of our best agricultural lands but are more readily treated. For example, soil acidity in heavily fertilized grazing lands can be rehabilitated by applications of lime; and areas of soil structural damage caused by continuous use of heavy equipment may be restored by conservation farming techniques.

Australian agriculture will undoubtedly continue to face competition from other forms of land use for resources; plantation forestry is currently replacing marginal agriculture in the higher wetter lands of south-eastern Australia; the requirement for land and water as recreation resources will also expand, and the competition for water resources from urban development will continue to increase. On the more positive side, the agricultural community including farmers, politicians, State government advisors and administrators, and agricultural land and water resources scientists are now well aware of these problems and are constantly seeking ways to assist Australian agriculture evolve to face the world market situation and to ameliorate the effects of resources constraints.

## CHAPTER FOURTEEN

# FORESTRY AND FISHING

---

## FORESTRY

Forests are an important national resource, renewable over time and providing a wide range of indispensable products and benefits to the community.

The cover of forest vegetation protects the soil from water and wind erosion, reduces flash flooding and siltation of water storages, and maintains the quality of water. Forests provide habitat for a variety of native animals and plants, many of which depend upon specific forest environments for survival.

Native and plantation forests contribute substantially to the Australian economy and especially to employment in rural areas. Forests also represent ecosystems of value for education, scientific research, tourism, recreation and other purposes. Not all forests are necessarily suitable for all types of uses at the same time. Yet careful management will ensure that the forests provide multiple benefits, in the long-term, for the Australian community.

### Forestry in the States and Territories

In the Commonwealth framework, State governments are primarily responsible for land management. Each State has a forest service responsible for the management and control of publicly-owned forests, in accordance with Forestry Acts and Regulations. The Office of the A.C.T. Administration, housed within the Department of the Arts, Sport, the Environment, Tourism and Territories, is responsible for the management and control of forests in the Australian Capital Territory. Forestry in the Northern Territory is the responsibility of the Northern Territory Conservation Commission. In Victoria and Western Australia the former independent forest services have been amalgamated with conservation and land management authorities.

### Commonwealth forestry administration

The Department of Primary Industries and Energy is responsible for forestry matters at the national level. Its primary responsibilities are the administration of a control on the export of unprocessed timber; liaison with State, national and international organisations concerned with forestry; and provision of the Secretariat for the Australian Forestry Council.

### Existing forest estate

Native forest is defined as land dominated by trees with an existing or potential mature height of twenty metres or more, including native stands of cypress pine in commercial use regardless of height. The total area of native forest was estimated at 41.3 million hectares as at 30 June 1986.

Of the 41.3 million hectares, 30.2 million hectares are in public ownership. The bulk of the 11.0 million hectares of private native forest are not actively managed for wood production and now include 2.4 million hectares of forest in the Northern Territory which were transferred from public to Aboriginal ownership.

Of the 30.2 million hectares of public forests, 5.0 million hectares have national park status and 12.9 million hectares are Crown forests, vacant or occupied under lease on which wood harvesting is carried out under government control but are not reserved and actively managed for wood production. Crown forests include 4.3 million hectares of tropical eucalypt and paperbark forests in northern Australia.

Of the 12.3 million hectares of State forests, 0.6 million hectares are special reserves managed for other than wood production purposes and on 4.4 million hectares, wood harvesting is restricted partly because of management priorities for other values and partly due to present economic inaccessibility. This leaves 7.3 million hectares or 17.7 per cent of a total 41.3 million hectares actively managed for wood production.

### DISTURBANCE TO AUSTRALIAN FORESTS AND WOODLANDS SINCE EUROPEAN SETTLEMENT

This map, produced by CSIRO using the Australian Resources Information System (Cocks et al., 1987) shows the extent to which Australian natural forests and woodlands have been disturbed (usually meaning cleared) since European settlement.

For this map, forests and woodlands are defined as including:

- tree communities with at least 10 per cent projected foliage cover;
- tall (>2 m) Eucalypt shrub communities with at least 10 per cent projected foliage cover (e.g. Mallee);
- mangroves.

Two factors, original vegetation and recent land cover, have been combined to estimate the changes to forests and woodlands since European settlement (Wells et al., 1984).

The percentages shown on this map are conservative, i.e. at *least* these percentages of the original forests and woodlands have been disturbed. Estimates of the percentage of forests and woodlands disturbed in each State are:

New South Wales, 49%; Victoria, 68%; Queensland, 35%; South Australia, 40%; Western Australia, 31%; Tasmania, 36%; Northern Territory, 0%; Australian Capital Territory, 60%.

| <b>Total . . . . .</b>          | <b>14,959</b> | <b>5,278</b> | <b>11,796</b> | <b>—</b>    | <b>2,970</b> | <b>2,962</b> | <b>3,266</b> | <b>51</b>     | <b>41,282</b> |

## NOTES:

1. Eucalypt forests are grouped into productivity classes in descending order of productivity. No specific indices of productivity have been developed for these classes and there can be some overlap, especially between States, in the relative productivity levels used to assign particular forest types to productivity classes.
2. Tropical eucalypt/paperbark not in commercial use.

| <b>Total . . . . .</b>    | <b>14,959</b> | <b>5,278</b> | <b>11,796</b> | <b>—</b>    | <b>2,970</b> | <b>2,962</b> | <b>3,266</b> | <b>51</b>     | <b>41,282</b> |

## NOTES:

1. Forest land managed for multiple use including wood production
2. Crown land vacant or occupied under lease on which wood harvesting is carried out under Government control but not reserved for that purpose
3. Land on which wood production is excluded (National Parks etc)

For more details of Australian native forest, see *Year Book* No. 61.

**NATIVE FOREST AREA OWNERSHIP/USE**

## Plantations

Tree plantations of a few coniferous species now provide a large part of Australian-grown wood supplies. The large scale establishment of these plantations was commenced by State Forest Services early this century, and in the case of South Australia, last century, to overcome the shortage of native coniferous timber. In an eleven year period covered by the *Softwood Forestry Agreements Acts 1967, 1972 and 1976*, the Commonwealth provided financial assistance to the States in the order of \$55 million for an extended program of softwood plantation development. A further Act in 1978 provided funds for a five year period to 30 June 1981 for the maintenance of the area of plantations established previously with Commonwealth funds.

Privately owned plantations amount to almost one-third the area under State ownership. New plantations (including replanting) are currently being established at the rate of 30,000 hectares per annum. A detailed account of the history and development of coniferous plantations and of the characteristics of individual species is included in *Year Book No. 59*. The following table shows total area of plantations in Australia classified by species.

PLANTATION AREAS CLASSIFIED BY SPECIES, 31 MARCH 1986

| Species group                   | (hectares)     |                |                |               |               |               |              |               |                |
|---------------------------------|----------------|----------------|----------------|---------------|---------------|---------------|--------------|---------------|----------------|

## Australian Forestry Council

The Commonwealth and the State Governments formed the Australian Forestry Council in 1964 to co-ordinate the development of the nation's forest resource in the general interest of the community. Membership of the council comprises the State and Northern Territory Ministers responsible for forestry and the Commonwealth Minister for Primary Industries and Energy. The New Zealand Minister for Forestry has observer status on Council. The Council is serviced by a Standing Committee and specialist sub-committees.

The Australian Forestry Council's current terms of reference are to:

- promote the management of Australian forests for the benefit of the people of Australia;
- advance the welfare and development of the industries based upon these forests;
- facilitate the exchange of information between parties interested in all the uses and the protection of the forests;
- facilitate consultation and co-ordination between the Commonwealth, State and Territory Governments on forestry matters, especially matters having interstate or national implications;
- formulate and recommend national forest policy for Australia;
- co-ordinate research into all aspects of forestry including the uses of forests and forest products;
- consider matters submitted to the Council by its Standing Committee.

The Council's National Forests Strategy, which outlines important basic principles and goals associated with the management of Australia's forests as well as providing a framework for the general development of programs and ongoing administration, was tabled in Federal Parliament in November 1986.

In recognition of the need to prepare shorter term statements of forestry management objectives, in 1986 the Council initiated the preparation of a draft Public Land Fire Management statement. Its Standing Committee prepared a position paper on Australian Bushfire Research in 1987.

## Research

### Commonwealth Scientific and Industrial Research Organisation—CSIRO

The Board of CSIRO has decided to combine research on forest production and on the processing of forest products into a Division of Forestry and Forest Products. The Division will continue to be concerned with both native and plantation forests, and with the broad ranges of forest uses including wood production, water supply, ecosystem conservation and scientific reference. The core areas of forestry research are forest ecology, forest diseases, forest physiology, forest operations, fire behaviour and soils nutrition. Work is also carried out on mathematical modelling and seed research.

It will also continue investigations on the properties of wood, and the processing and uses of wood and wood products, to assist in the effective use of Australian wood resources. The programs include processing of wood and timber, technology of fibre separation, wood and fibre properties, composite wood and paper products, assessment of cellulosic resources and conservation of wood-based materials. Technology for the production of high value chemicals from wood and other plant materials is also being investigated.

Tropical rainforest research will be carried out in the Division of Wildlife and Ecology. Other aspects of forestry-related research are carried out in the Divisions of Plant Industry, Entomology, Soils and Water Resources.

### Education

The Australian National University and the University of Melbourne offer undergraduate courses leading to a Bachelor of Science degree in Forestry. Most States provide for sub-professional forestry training.

Each year, the Department of Primary Industries and Energy makes available postgraduate awards for full-time research, leading to the degree of Master and/or Ph. D at an Australian university. The Department also administers an award funded from a private bequest for postgraduate study at Oxford University for one year.

## Timber and timber products

The selected details shown below have been compiled from the annual census of manufacturing establishments.

The woodchip export industry uses timber which is unsuitable for sawmilling and is not required by the Australian pulp, paper and reconstituted board industries. Before the advent of the woodchip export industry much of this material was left standing in the forest after logging, where it inhibited regeneration. After several cycles of selective logging since European settlement, many forests contained large volumes of over-mature and defective timber for which there was no market. The woodchip export industry, by making it economic to remove this poor quality timber, has enabled degraded forests to be regenerated into faster-growing, more productive ones. Considerable quantities of sawmill waste material, which would otherwise be burnt, are also chipped for local pulpwood-using industries and for export.

About 4.5 million tonnes of woodchips worth \$260 million were exported from Australia in 1986. Over 95 per cent of Australia's woodchip exports go to Japan where they are used to produce high quality printing and writing papers. The remainder goes to Korea and Taiwan.

In addition to the products listed above, exports for 1985-86 of pulpwood (virtually all in the form of woodchips) were 4,729,892 tonnes (green).

## FISHING

### Source and basis of statistics

Statistics presented in this section are obtained from the collections of State Fisheries Authorities. In all States except Queensland and Tasmania, the information is derived from returns collected from licensed fisherpersons. In Queensland the statistics have, to date, been based mainly on Fish Board receipts, but a new collection from fishermen, fish wholesalers and processors is now being developed. Tasmanian data are obtained from buyers and processors. Additionally, details of New South Wales tuna production are supplied by CSIRO and particulars of Australian pearl culture have been collected and supplied by the Australian Fisheries Service, Department of Primary Industries and Energy.

Australian fisheries production statistics are generally in terms of the form in which the products are taken from the water. For example, the statistics of fish production published in this chapter are in terms of 'estimated live weights' which are calculated from landed weights by using conversion factors for each species in each State. These conversion factors allow for the fact that the quantities of fish reported are frequently in a gutted, headed and gutted, or otherwise reduced condition. Crustaceans are reported on an 'estimated live weight' basis and molluscs (edible) on a 'gross (in-shell) weight' basis. The figures for pearl shell and trochus shell refer to the actual quantities of dry shell for sale and exclude the weight of the fish.

For more details of employment and boats and equipment for general fisheries and particulars of the whaling industry see earlier *Year Books*.

### Fisheries resources and their commercial exploitation

#### Fish

Over 3,000 species of marine and freshwater fish occur in and around Australia. Australian fisherpersons concentrate their efforts on estuarine, coastal, pelagic (surface and mid-water swimming) and demersal (bottom living) fish that occur off the north-east, south-east and south-west coasts. Off north Australia, barramundi (*Lates calcarifer*) constitutes the most important estuarine and coastal species, while in the south-east and south-west regions, mullet (mainly *Mugil cephalus*), bream (*Acanthopagrus* spp.), Australian salmon (*Arripus trutta*) and Australian herring (*Arripus georgianus*) are important catch components.

Major pelagic fisheries are Spanish mackerel (*Scomberomorus commersoni*) off north Australia, and southern bluefin tuna (*Thunnus maccoyii*), jack mackerel (*Trachurus declivis*) snoek (*Leionura atun*), pilchards (*Sardinops neopilchardus*) and anchovies (*Engraulis australis*) off south-east Australia. Southern bluefin tuna are also fished off south-west Australia.

A large multispecies demersal fishery that targets on flathead (*Neoplatycephalus* and *Platycephalus* spp.), morwong (*Nemadactylus* spp.), redfish (*Centroberyx affinis*), gemfish (*Rexea solandri*), orange roughy (*Hoplostethus atlanticus*), trevally (*Pseudocaranx dentex*) and blue grenadier (*Macruronus novaezelandiae*), exists off south-east Australia. Demersal inshore snapper (*Chrysophrys auratus*) fisheries exist off south-west and south-east Australia; in the latter region, stocks of whiting (*Sillaginidae*) are also fished. In the northern tropical region, reef fish such as cods (*Epinephelus* spp.) are exploited. A large demersal fishery for school and gummy sharks (*Galeorhinus australis* and *Mustelus antarcticus*, respectively) is centred in Bass Strait.

Establishment of the 200 nautical mile Australian Fishing Zone (AFZ) in 1979 covering a total of 8.9 million square kilometres, brought portions of oceanic tuna stocks, and demersal and pelagic fish stocks previously exploited by foreign fishing vessels, under Australian control. Foreign fishing operations in the pelagic gill-net fishery off the north coast catch sharks (mainly *Carcharhinus* spp.), tuna (*Thunnus tonggol*) and Spanish mackerel; while in the demersal pair trawl fishery off the north-west coast, a tropical multispecies fauna, that includes threadfin bream (*Nemipteridae*), tropical snappers (*Lutjanidae*), emperors (*Lethrinidae*), goatfish (*Mullidae*) and hair tails (*Trichiuridae*) is taken. Following the introduction of controls on the length of gill-nets which can be used, foreign pelagic gill-net operations have ceased.

## Crustaceans

Prawns (*Penaeus* and *Metapenaeus* spp.) provide the most valuable fishery in Australia and are taken in estuarine, coastal and offshore waters of all States except Tasmania. The western and southern rock lobsters (*Panulirus longipes cygnus* and *Jasus novaehollandiae*), also a valuable resource, are taken on rocky reefs around the southern half of Australia. Bay lobsters (*Thenus* spp. and *Ibacus* spp.) are taken incidentally to prawn trawling operations. Crabs (*Scylla* spp. and *Portunus* spp.) are taken mainly in Queensland, New South Wales and Western Australia.

## Molluscs (edible)

Naturally-occurring oysters are harvested in all States; in New South Wales and Queensland the Sydney rock oyster (*Crassostrea commercialis*) is cultured commercially. The introduction of the Pacific oyster (*Crassostrea gigas*) to Tasmania and South Australia has provided a limited supply in those States. Following a serious decline in catches in the scallop (*Pecten meridionalis*) fishery based on stocks in Port Phillip Bay in Victoria, new offshore beds were located in southern New South Wales, eastern Victoria, northern Tasmania and south-western Western Australia. However, substantial fluctuations in abundance have resulted in erratic production from year to year. A fishery based on the saucer scallop (*Amusium balloti*) is located off south and central Queensland and there is a small fishery for the same species in Shark Bay, Western Australia. An important abalone (*Haliotis* spp.) fishery has been developed since 1964 in south-east Australia with Tasmania, Victoria and South Australia providing the bulk of the catch. There is also a small abalone fishery in south-west Australia. Mussels (*Mytilus planulatus*) are harvested in Victoria, Western Australia and New South Wales. Prior to 1978 small quantities of cephalopods, mainly squid, were produced in many localities. Feasibility fishing located promising squid resources (*Nototodarus gouldi*) in the south-east. Squid (*Loligo* spp.) form an important component to the trawl catch in the Arafura Sea.

## Pearl shell and trochus shell

The shell of the Australian species of pearl oyster (*Pinctada maxima*) is taken from various localities in the tropical waters of Australia, between Broome in Western Australia and Cairns in Queensland, for the manufacture of buttons, knife handles, etc. Live pearl shell is used for pearl culture, *Pinctada maxima* being capable of producing pearls which are the largest in the world and which command top market prices. Trochus shell is found mainly on coral reefs off the Queensland coast, although small quantities occur in Western Australia.

## Whales

Whales are now a protected species in the AFZ.

## Fisheries administration and research

The Commonwealth Parliament has enacted a number of laws dealing with fisheries in Australian waters beyond territorial limits. The fisheries laws of the States and the Northern Territory apply to all kinds of fishing within the territorial sea and in inland waters. These laws require the licensing of persons and boats in the commercial fisheries and provide a range of other regulatory powers. The Commonwealth Government laws relating to fishing are outlined below.

### *Fisheries Act 1952*

This Act applies to commercial fishing for swimming species, by Australians in waters extending from 3 to 200 nautical miles seaward of the territorial sea baseline of Australia and the external territories excluding the territorial sea of another country, and by foreign boats in the 200 nautical miles AFZ. The AFZ comprises waters which extend 200 nautical miles seaward of Australia's territorial sea baselines but does not include territorial seas within the accepted fishing zones of adjacent countries or waters adjacent to Australia's Antarctic Territory.

*Continental Shelf (Living Natural Resources) Act 1968*

This Act regulates the searching for and taking, from the continental shelf of Australia and the external territories, of living sedentary species by Australians and foreigners. Sedentary species are those that, at the harvestable stage, are either immobile on or beneath the seabed or are unable to move except in constant physical contact with the seabed. The continental shelf is the seabed beyond the territorial sea and adjacent to permanently exposed land masses, extending to a depth of 200 metres or, beyond that depth, to where the exploitation of the seabed is possible.

*Torres Strait Fisheries Act 1984*

This Act gives effect in Australian law to the fisheries elements of the Torres Strait Treaty. The Act applies in the area of Australian jurisdiction in the Torres Strait Protected Zone and areas outside but near that zone proclaimed in respect of particular fisheries which Australia and Papua New Guinea have agreed to manage jointly under the Treaty, or which are referred to in the Treaty.

These three Acts require the holding of licences and empower the Minister to prohibit fishing activities as necessary for the conservation of resources and the management of the fisheries. The *Fisheries Act 1952* authorises the publication of management plans having the force of law in relation to particular fisheries.

*Foreign Fishing Boats Levy Act 1981; Fisheries Agreements (Payments) Act 1981*

These Acts facilitate the imposition and collection of access fees for foreign boats fishing in the AFZ.

*Fisheries Levy Act 1984*

This Act imposes a levy on prescribed classes of licences under the *Fisheries Act 1952* or the *Torres Strait Fisheries Act 1984* or on units of fishing capacity created by management plans under the first of those Acts.

**Administration**

Australian fisheries are administered by the authority having jurisdiction over the waters concerned. In inland waters and in waters within territorial limits, administration is the responsibility of the State or Territory fisheries authority. In proclaimed waters, and on the continental shelf beyond territorial limits, administration is the responsibility of the Commonwealth Government which, by agreement, has delegated to State Fisheries Authorities the necessary authorities for day-to-day administration of the Acts.

The Commonwealth and all State Parliaments, as well as the Northern Territory House of Assembly, have enacted amendments to fishery laws for the purpose of implementing the fisheries elements of the offshore constitutional settlement adopted by the Premiers' Conference in 1979. Those amendments, which came into force on 14 February 1983, authorise the Commonwealth and one or more States to enter into a formal legal arrangement to apply a single law (Commonwealth or State) to the management of a particular fishery from low water mark and to vest executive power under that law in:

- (i) a joint authority, the membership of which would comprise the Commonwealth and the relevant State or States;
- (ii) a State alone; or
- (iii) the Commonwealth alone.

The Offshore Constitutional Settlement (OCS) is now in place for fisheries in waters off five states; Queensland, South Australia, Western Australia, Tasmania and Victoria. OCS arrangements simply rationalise jurisdiction and do not specify new rules for management of the fisheries concerned. This rationalisation of responsibilities will not only reduce administration costs but will mean that many fisherpersons will only require one fishing licence in future.

The administration of the fisheries is directed to a number of objectives. The two most important are conservation and management of the living resources of the AFZ to ensure that they are not endangered by over exploitation; and achievement of the optimum utilisation of the living resources by the Australian fishing industry and foreign interests. Consistent with these objectives a number of controls have been introduced to prevent the depletion of the more heavily fished species and to ensure the optimum utilisation of resources. These controls take the form of individual transferable catch quotas, seasonal and area closures,

gear limitations, minimum size requirements and limited access rights, as well as outright prohibitions on the taking of certain species.

The Fisheries Development Trust Account (established under the *Fishing Industry Act 1956*) and the Fishing Industry Research Trust Account (established under the *Fishing Industry Research Act 1969*) are available to support, financially, projects for the development and management of the fisheries and fishing industry which are consistent with the purposes of those Acts. The former was established with the proceeds of the sale of the assets of the Australian Whaling Commission and is replenished from Consolidated Revenue as necessary. The latter is a matching fund into which is paid each year an appropriation from Commonwealth Government Revenue equal to amounts collected from the fishing industry by the State Fisheries Authorities and paid into appropriate State research accounts for the same purpose.

## Research

The main aim of fisheries research in Australia is to provide a background of biological, technical and economic information which will provide guidance for the efficient and rational utilisation of fisheries resources. To this end much of the research already undertaken has been directed at formulating recommendations for management of various fisheries. Research work, including feasibility fishing projects involving foreign fishing vessels, is also carried out and is expected to lead to the development of new fisheries, the expansion of under-exploited fisheries, greater economy in operations and the use of more efficient equipment and methods.

Organisations in Australia at present engaged in research into fisheries matters are:

- (i) CSIRO Division of Fisheries Research, which has its headquarters and main laboratory at Hobart, Tasmania, and regional laboratories in Western Australia and Queensland (fisheries science);
- (ii) CSIRO Division of Oceanography, which has its headquarters and laboratory at Hobart, Tasmania;
- (iii) CSIRO Division of Food Research, conducts research into handling, storage, processing and transportation of fish at its laboratory in Hobart, Tasmania;
- (iv) State fisheries departments with laboratories have been established in Sydney, Melbourne, Brisbane, Perth, Hobart, Darwin and Cairns; research vessels are operated by New South Wales, Victoria, Queensland, Western Australia, South Australia and Tasmania;
- (v) Bureau of Rural Research, Department of Primary Industries and Energy, Canberra;
- (vi) Bureau of Agricultural Economics, Canberra (economic and marketing research); and
- (vii) private fishing companies (surveys of fisheries resources, research into handling, processing and marketing).

## Boats and equipment used in fisheries

### Fish, crustaceans and molluscs (edible)

The boats used for the estuarine fisheries are mostly small vessels propelled by diesel or petrol engines of low power. The offshore vessels range up to 40 metres in length and are almost invariably powered by diesel engines. Most of them have either insulated holds and carry ice, or are equipped with dry or brine refrigeration. Some rock lobster vessels are fitted with wells in which the catch is kept alive.

The following are the types of equipment most commonly used in the main fisheries: *mullet*—beach seine, gill-net; *shark (edible)*—long-lines, gill-net; *Australian salmon*—beach seine; *snoek*—trolling lines; *flathead*—Danish seine, otter trawl; *snapper*—long-lines, traps, gill-net, handline; *morwong*—Danish seine, otter trawl, traps; *whiting*—handline, otter trawl, Danish seine, beach seine, gill-net; *garfish*—beach seine; *Spanish mackerel*—trolling lines; *tuna*—pole and live-bait, purse seine, trolling lines (lampara nets and purse seines are used for taking live bait for tuna); *prawns*—otter trawl, beam trawl, beach seine net; *rock lobster*—pots, traps; *scallops*—dredge, otter trawl; *abalone*—diving using hookah gear; and *pilchards, anchovies, jack mackerel and striped tuna*—purse seine.

## Pearls, pearl shell and trochus shell

Ketch-rigged luggers about 15 metres long which carry crews of eight to fourteen members are used for pearl shell fishing in northern Australia.

## Production, processing and domestic marketing of fisheries products

### Value of fisheries production

The following table shows the gross value of fishing by States. As the value of materials used in the course of production is not available for all States, it is not possible to show a comparison of net values. Gross value of production is the value placed on recorded production at the wholesale price realised in the principal markets. In general, the 'principal markets' are the metropolitan markets in each State, although, in cases where commodities are consumed locally or where they become raw material for a secondary industry, these points are presumed to be the principal markets. Gross value includes marketing costs which were estimated at \$18.8 million for Australia for the year 1979-80. Details on marketing costs are not available for 1980-81 and subsequent years.

Australian totals are not available beyond 1980-81, due to estimates for various States not being available.

### FISHERIES: GROSS VALUE OF PRODUCTION (\$'000)

### Processing of fish, crustaceans and molluscs

Processing plants are located strategically throughout Australia close to fishing grounds. A number of shore-based plants have been established in northern Australia to service the northern prawn fishery.

Rock lobsters, prawns, abalone, tuna, scallops and some fin fish are frozen for export; tuna, snoek, Australian salmon and abalone are canned; small amounts of fish are smoked; and some molluscs are bottled. Hand labour is still used extensively in processing operations, but mechanisation is being progressively introduced.

Ice is used extensively for the chilling of fish taken in estuarine and inshore fisheries. Refrigeration is used particularly on vessels operating in the tuna and prawn fisheries to chill or freeze the catch. An increasing range of fish products, including fresh-chilled tuna, live rock lobster, abalone and sea urchin roe, are being air-freighted to export markets, particularly Japan.

Fish, crustaceans and molluscs intended for export are processed in establishments registered under the Export (Fish) Regulations. Edible fish for local consumption is mainly dispatched fresh-chilled to markets.

## Pearls, pearl shell and trochus shell

(a) Figures refer to the fishing season commencing in the years shown. (b) Excludes manufacturing shell produced from pearl culture operations. (c) A pearl weight measurement equivalent to 3,769 grams.

## Domestic marketing of fisheries' products

Although a substantial proportion of the tuna and Australian salmon catches are canned, the greater part of Australian fish production is marketed fresh-chilled.

Marketing arrangements for fresh fish vary. In New South Wales, fish marketing is the responsibility of the Fish Marketing Authority which operates the Metropolitan Fish Markets. In other coastal centres of New South Wales, fisherpersons' co-operatives may become registered as local fish markets. In Queensland until recently the Fish Board sold all production on behalf of fisherpersons in that State, except fish intended for export and interstate trade. However, new legislation was passed in March 1982 giving fisherpersons a choice of selling their catch either through the Fish Board, fisherpersons' co-operatives or licensed private processors and wholesalers. In Victoria, Western Australia, South Australia

---

and Tasmania, there is no restriction on market outlets. In Victoria, Western Australia and South Australia, most fish is sent to metropolitan wholesale fish markets for auctioning; small quantities are processed for sale locally, chiefly by co-operatives. Nearly all fresh fish in Tasmania is consigned direct to processors. The principal outlets for fish products in Australia are retail and catering establishments.

## CHAPTER FIFTEEN

# MINERAL INDUSTRY

## Geology and mineral resources

### General geology

Most of the western and central part of the Australian continent consists of basement rocks of Precambrian age. Younger Palaeozoic rocks, mostly of geosynclinal origin, form a discontinuous belt several hundred kilometres wide extending from north Queensland to Tasmania. Mesozoic platform sediments form a broad zone separating the Palaeozoic and Precambrian rocks and extending from the Gulf of Carpentaria to central New South Wales. Cainozoic rocks occur mainly in Victoria, south-western New South Wales and southern South Australia, and as residual basalt cappings over extensive areas of the Palaeozoic rocks of eastern Australia.

### Economic geology

Minerals of economic significance occur throughout Australia, their geological age ranging from Precambrian to Recent. Many of the large deposits such as those at Broken Hill (New South Wales), Mount Isa (Queensland), Olympic Dam (South Australia) the Kalgoorlie and Pilbara regions of Western Australia and the Alligator Rivers area of the Northern Territory are Precambrian in age. In eastern Australia the major deposits such as the Elura, Cobar, Woodlawn and Rosebery base-metal deposits and most of the black coal deposits, are Palaeozoic in age. The black coals of the Moreton district of Queensland, north-east New South Wales and Leigh Creek, South Australia are of Mesozoic age. Deposits formed in Tertiary times include the brown coal in Victoria, the bauxites of Weipa (Queensland), Gove (Northern Territory) and the Darling Range (Western Australia) and the nickeliferous laterites at Greenvale (Queensland).

### Mineral resources

Australia is self-sufficient in most minerals of economic importance (and much more than self-sufficient in some). Major minerals with known reserves adequate for domestic demand and exports include bauxite (aluminium), black coal, clays, copper, diamonds, gold, iron ore, lead, manganese, natural gas, nickel, salt, silver, tin, uranium and zinc.

A special article on the development of Australia's mineral industry is included at the end of the Chapter. For further details of principal Australian mineral deposits, and notes on principal mineral resources, see *Year Book* No. 61, pages 925-932 and the Australian Mineral Industry Quarterly and Annual Reviews.

### Administration

All mineral rights in Australia are vested in the Crown except those on land which was granted before the Crown began to reserve mineral rights. In practice, these private mineral rights are not important. In the States, these rights are held by the State governments. On 1 July 1980, executive authority with respect to mining and minerals except in relation to certain prescribed substances within the meaning of the Atomic Energy Act (principally uranium) was transferred from the Commonwealth Government to the Northern Territory Government. Private mineral rights in the Australian Capital Territory are vested in the Commonwealth Government. The Commonwealth Government is able also to influence overall development and production activity in the mineral industry by virtue of its statutory powers with respect to international trade, customs and excise, taxation and loan raisings. Certain specially-formed bodies such as the Joint Coal Board and the Australian Atomic

Energy Commission have been given administrative responsibility in defined areas. The government has also established consultative mechanisms, such as the Australian Coal Consultative Council, to provide an advisory, rather than administrative, role.

## Mineral exploration and development

### Onshore

Each State or Territory has its own mining Acts or Ordinances and regulations governing the prospecting for and working of mineral deposits. These Acts and regulations, although similar in principle are different in detail. They all make provision for a miner's right to prospect and for small mining leases for mineral production. The principles embodied were established many years ago when mining operations were generally small scale and labour-intensive. Although amendments have been enacted to modernise the legislation, it is generally inadequate for the large-scale capital-intensive operations often involved with modern mineral development. For this reason, a large enterprise may take the course of acquiring mining titles by negotiations with the appropriate Minister for Mines and having the agreed terms and conditions embodied in an Act of the State Parliament. This method of acquisition has been used in several cases where the leasing company undertook an obligation (such as the erection of a large treatment works) in return for leases over large areas for a long period, and has become more common in recent years (e.g. iron ore in Western Australia, coal and bauxite in Queensland, bauxite in the Northern Territory). Mining legislation enacted in recent years is simpler and more suited to modern conditions.

As a result of the introduction of large-scale modern prospecting methods (particularly airborne prospecting), small prospecting areas were found to be unsuitable in some instances, and steps have been taken in the States and Territories to ensure the availability of large areas for prospecting by interested persons. Large areas may be made available by provision within the mining Acts or Ordinances for the issue of authorities to prospect over an area defined by a written agreement which also sets out provisions as to the amount of money to be spent, methods of prospecting, tenure of the agreement, etc.

The tenure of such areas is limited (usually to one or two years) and, if renewed for a further period, is only over an area selected from the larger area (usually 50 per cent) as a result of work done during the life of the initial agreement. It does not give the holder any rights over, or authority to prospect on, land already held under a mining title within the agreed area. Unless specifically stated in an agreement, the discovery of minerals, whether inside or outside an area covered by an authority to prospect, gives the discoverer no legal rights except the right to apply for a mining lease over the area in which the discovery was made. Suitable prospects are converted to mining tenements by making application for lease under the appropriate mining Act.

### Offshore

Following the enactment of the *Seas and Submerged Lands Act 1973* the High Court confirmed that the Commonwealth has sovereignty over the territorial sea and sovereign rights over the resources of the whole of Australia's continental shelf. However, in the Offshore Constitutional Settlement between the Commonwealth and the States reached in June 1979, it was agreed that responsibility for mining of the seabed on the landward side of the outer limit of the 3 nautical mile territorial sea should lie with the States, while the Commonwealth should have responsibility for areas beyond.

*The Minerals (Submerged Lands) Act 1981* passed by the Commonwealth Parliament in June 1981 follows the scheme of the offshore petroleum legislation amendments passed in 1980 and provides for Joint Commonwealth/State Authorities to be responsible for major matters under the legislation with the States being responsible for day-to-day administration. The Commonwealth is working with the States to expedite the implementation of the Minerals (Submerged Lands) Act by all governments. The Commonwealth is also taking steps to proclaim as much of its Act as is necessary for exploration to proceed, under the planned joint arrangements. In the meantime administration of offshore mining is carried out under the States' onshore mining legislation on an interim basis.

The mining code under the new legislation provides for a two-stage system of titles: the exploration permit, which covers all forms of exploration, and the production licence, which covers development.

## Petroleum exploration and development

### Onshore

In Australia full control of petroleum mining rights is vested in the government or administration of each State or Territory. Any company, organisation or individual proposing to undertake petroleum exploration or development must first satisfy the government concerned that the necessary financial and technological resources are available to carry out the operation.

There are three main types of petroleum title:

- (i) the exploration title, where the holders are typically given exclusive rights over the area to conduct petroleum exploration, including the drilling and testing of wells;
- (ii) the production title, which is required for commercial production of petroleum and gives the holder the right to produce and sell the petroleum subject to the payment of a royalty calculated as a fixed percentage of the well-head value of the petroleum produced; and
- (iii) the retention licence enacted in the Northern Territory, covering onshore petroleum exploration and production under the *Petroleum Act 1984* and is intended to allow tenure over currently non-commercial discoveries.

Royalty arrangements vary from State to State. All States and the Northern Territory determine royalties derived from onshore production as a percentage of the derived well-head value of all petroleum production.

The Commonwealth has passed legislation that provides for the replacement of all Commonwealth excise on liquefied petroleum gas and crude oil, and State ad valorem royalty, with a resource rent royalty where the relevant State government has negotiated an acceptable agreement with the producers and has agreed upon a satisfactory revenue sharing formula with the Commonwealth.

### Offshore

As part of the Offshore Constitutional Settlement between the Commonwealth and the States, responsibility for administering petroleum exploration and production within the outer boundary of the three nautical mile territorial sea rests with the relevant State or Territory while the Commonwealth has responsibility for the continental shelf beyond the territorial sea. The *Petroleum (Submerged Lands) Act 1967* provides for a Joint Authority for the adjacent area of each State and the Northern Territory (beyond the territorial sea limit) consisting of the Commonwealth Minister and the State/Territory Minister. The Joint Authorities are concerned with major matters arising under the legislation and in the case of disagreement the view of the Commonwealth Minister prevails. Day-to-day administration is the responsibility of the State or Territory Minister as the Designated Authority and State or Territory officials.

The mining code applicable under the legislation provides for a three stage system of titles: the exploration permit, which covers all forms of exploration including drilling, the retention lease which provides tenure over currently non-commercial discoveries and the production licence, which covers development and production.

### Availability of exploration acreage

As part of the government's aim to encourage petroleum exploration, regular releases of offshore exploration acreage are made.

### Mineral royalties

The collection by governments of royalties for the production of minerals within their area of authority is an internationally-accepted practice. In Australia, the responsibility for mineral royalties is largely a State concern, and all States currently collect some form of mineral royalty payments.

In recent years there has been an important basic change in the system of establishing royalty commitments, and it is now quite common for State governments to negotiate special royalty rates with companies which are seeking mineral leases for large scale developments. These royalty rates may vary, depending on whether production is for export or for domestic processing. The rates for a particular mineral may also vary between producers. Important examples of this type of royalty agreement are the iron ore development agreements in Western Australia and coal development agreements in Queensland. Mineral royalties received by governments in recent years are shown in the following table.

**MINERAL ROYALTY RECEIPTS: GOVERNMENTS**

(a) Includes royalties on sand and gravel from Crown lands. (b) Includes royalties on brown coal paid by State Electricity Commission. (c) Includes royalties received under the *Petroleum (Submerged Lands) (Royalty) Act 1967-68*. (d) Excludes the mining royalties paid into Aboriginal Benefits trust fund prior to 1978-79.

### Joint Coal Board

The Joint Coal Board was established in 1946 under joint legislation of the Commonwealth Government and of the State of New South Wales to carry out special administrative functions in regard to the New South Wales black coal mining industry. In summary, the Board's functions are to:

- ensure that coal is produced in the State of New South Wales in such quantities and with such regularity as will meet requirements throughout Australia and in trade with other countries;
- ensure that the coal resources of the State are conserved, developed, worked and used to the best advantage in the public interest;
- ensure that coal produced in the State is distributed and used in such manner, quantities, classes and grades, and at such prices as are calculated best to serve the public interest and secure the economical use of coal and the maintenance of essential services and industrial activities;
- promote the welfare of workers engaged in the coal industry in the State.

### Government assistance

The Commonwealth Government and the various State governments provide assistance to the mineral industry in a variety of ways. The main forms of assistance are discussed on the following pages.

#### Commonwealth Government assistance

Assistance provided by the Commonwealth Government takes the form of income taxation concessions, subsidies, bounties, and technical assistance, mainly through the work of the Bureau of Mineral Resources, Geology and Geophysics (BMR) and the Commonwealth Scientific and Industrial Research Organisation (CSIRO) as well as through the National Energy Research, Development and Demonstration Program.

#### Income taxation concessions as at 30 June 1987

Income derived from mining principally for gold in Australia is exempt from tax. The exemption is also available in respect of income derived from mining principally for gold and copper if the value of the gold obtained is not less than 40 per cent of the value of the total output (excluding the value of pyrites).

Special deductions for capital expenditure incurred in prospecting and mining for petroleum (including natural gas) are allowable to a petroleum mining enterprise engaged in these operations in Australia. Capital expenditure allowable to petroleum mining enterprises includes, broadly, the amount of successful cash bids and the costs of exploratory surveys, drilling and well-head plant; plant for the liquefaction of natural gas; access roads; and housing and welfare. The enterprise is entitled to these special deductions against income from any source although in the case of cash bids, the deduction only becomes available if a production licence is granted. While the special deductions for prospecting expenditure are

deductible immediately against the net income of the enterprise, the deductions for capital expenditure on mining are allowable over the life of the oil or gas field or over ten years, whichever is the lesser, on a straight line basis.

An enterprise mining or prospecting for minerals other than petroleum and gold may also be allowed special deductions for capital expenditure. Broadly, allowable capital expenditure includes expenditure on exploration and prospecting; preparation of a site for extractive mining operations; buildings; other improvements and plant necessary for those operations; access roads; certain treatment plant; and housing and welfare.

The allowable capital expenditure of a general mining enterprise, other than costs of exploration, may be deducted against income from any source over the life of the mine or over ten years, whichever is the lesser, on a straight line basis. Expenditure incurred by a general mining enterprise in exploring for minerals is deductible immediately against the net income of the enterprise from any source. Undeducted exploration and development expenditure of general mining and petroleum companies may be carried forward indefinitely, although in respect of such expenditure actually incurred in 1985-86 and subsequent financial years the companies may elect to have such undeducted expenditure treated as carry-forward losses transferable to another company in the same group.

Annual deductions for depreciation on petroleum mining plant or general mining plant may be allowed in lieu of spreading the cost over the life of the oil field or mine. The cost of exploration plant may also be deducted under the depreciation provisions of the law. The investment allowance scheme may permit a deduction at the rate of 18 per cent of the cost of certain new plant, provided it was contracted for (or construction commenced) before 1 July 1985.

Special deductions are allowable for capital expenditure incurred on certain transport facilities for use in Australia primarily and principally, for the transport of raw minerals (other than petroleum or gold) and certain specified products obtained from the processing of such minerals, or for transporting petroleum between the oil or gas field and a refinery or other terminal. The special deductions apply to expenditure incurred on a railway, road, pipeline or similar transport facility and on certain port facilities or other facilities for ships. Allowable expenditure on transport facilities is deductible in equal annual instalments over a period of ten or twenty years at the option of the mining enterprise.

#### **Payments to producers of phosphate fertilizers.**

The *Phosphate Fertilizers Subsidy Act 1986* provides for a subsidy to be paid on phosphatic substances produced in Australia and sold in Australia for use as a fertilizer. The subsidy varies according to the percentage of available phosphorous content of the fertilizer. When this is below 10 per cent, the subsidy is \$153 for each tonne of available phosphorous content. When the percentage available is 10 per cent or more but less than 15 percent, the subsidy is \$163 for each tonne of available phosphorous content of the fertilizer. In any other case the subsidy is \$188 for each tonne of available phosphorous.

#### **Payments to producers of nitrogenous fertilizers**

The *Nitrogenous Fertilizers Subsidy Act 1986* provides for a subsidy to be paid on inorganic nitrogenous substances produced in Australia and sold for use in Australia as a fertilizer. Subsidy is payable at the rate of \$20 per tonne of the nitrogen content of which the substance consists.

#### **Bureau of Mineral Resources, Geology and Geophysics—BMR**

The role of BMR is to:

- develop an integrated, comprehensive, scientific understanding of the geology of the Australian continent, the Australian offshore area and the Australian Antarctic Territory, as a basis for minerals exploration; this to be done where appropriate in co-operation with State Geological Surveys and other relevant organisations and having regard to priorities for the search for minerals approved by the Minister for Primary Industries and Energy;
- be the primary national source of geoscience data and to publish and provide information;
- undertake mineral resource assessments in accordance with programs and priorities approved by the Minister for Primary Industries and Energy with the advice of the BMR.

At 31 August 1987, BMR had a full-time staff of approximately 565 people, including 245 research and other scientists, (geologists, geophysicists, chemists, engineers, and mineral economists etc.), 215 technical and cartographic and around 105 clerical and other support staff.

BMR's research program is carried out by four Divisions—Geophysics, Continental Geology, Marine Geosciences and Petroleum Geology, and Petrology and Geochemistry. Mineral and petroleum resource assessments are undertaken by the Resource Assessment Division which includes Mineral Commodities Branch, a Petroleum Branch, a Mineral Product Evaluation Branch, and a Geoscience Computing and Database Branch. Other branches are Planning and Programs, and Special Projects and Geoscience Services.

BMR maintains laboratories in Canberra engaged on geochemical, geochronological, organic geochemistry, and petroleum technological studies, and basic research into the design and testing of geophysical equipment. It also maintains geophysical observatories at Kowen Forest (Australian Capital Territory), Mundaring (Western Australia), Mawson (Antarctica), and Macquarie Island. The geophysical observatories are engaged in geomagnetic, ionospheric, and seismology research.

### **State government assistance**

In addition to free assays and determinations of rocks and minerals carried out for prospectors by the Mines Departments of the States and Territories, technical officers of these departments provide advice to the mining and allied industries where required, carry out field examinations of mining prospects, advise on exploration and development, select sites for water supply, and generally give a free technical service to the mining industry.

#### **New South Wales**

The primary objective of the Department of Mineral Resources is to promote the responsible development of mineral resources in New South Wales. The Department administers the various Acts (Coal, Petroleum and Mining) and grants titles to encourage and facilitate the exploration for, prospecting and development of, the State's mineral resources. The Department's staff is deployed in many diverse areas of activity to encourage and assist mining and resource development projects by the mining industry.

A wide range of services, information and advice is provided on many subjects including geological and geophysical investigations, scientific and chemical research, geological and metallogenic mapping, prospecting, mining legislation and administrative procedures. The Geological and Mining Museum, one of the State's foremost specialist museums, is maintained by the Department, as is the reference library of geology, mining and allied topics situated at the Department's head office and Bore Core Library situated at Londonderry, near Penrith.

The Department is engaged in the continuous assessment of the State's mineral resources; its coal exploration and assessment programme in particular has identified many significant coal deposits.

#### **Victoria**

The Department of Industry, Technology and Resources advises on, monitors, co-ordinates and implements minerals and energy policy. The Department conducts geological, ground-water and mineral surveys, produces geological maps, and issues scientific and technical reports thereon. Drilling operations are carried out and the results are used in sedimentary basin studies to evaluate the petroleum, mineral and groundwater potential of the State. A comprehensive library is maintained, while a core library retains cores and cuttings from government and private drilling operations. The administration of petroleum, pipeline, mining and extractive industry legislation ensures that mineral, stone and petroleum exploration and production (both onshore and offshore), mining and quarrying are regulated and controlled. Technical assistance and advice are available for mineral, stone, groundwater and petroleum exploration and prospecting. Five stamp batteries located throughout the State provide an ore-crushing service to enable test crushing to be made at nominal cost. Information is available on mining law and mineral statistics. Assays of ores and analytical services are also available from the State Chemical Laboratory for a fee.

### Queensland

The Queensland Department of Mines encourages, assists and regulates the search for and development of mineral and energy resources, working through a system of permits, leases and licences issued under Acts of Parliament. Advice on these and associated matters is provided through the Honourable the Minister for Mines and Energy to the government. The Department also provides services and advice to government on a variety of geological, economic and safety matters.

Staff includes qualified and experienced professionals including mining and petroleum engineers, geologists, geophysicists, technical experts in the mechanical and electrical fields, surveyors, ecologists, cartographers, fuel technologists, economists, computer scientists, journalists and administrators.

Detailed information of assistance to mineral searchers is collated from in-house geological and geophysical studies and continuous scientific appraisal of results achieved and reported by private sector exploration groups. The information effort is underpinned by a program of geological mapping and by Departmental drilling for stratigraphic information, resource assessment and research purposes; a core library provides a storage and retrieval system for cores, cuttings, and geological data.

The Department carries out regular inspections to ensure mine safety and provides an expert technical advisory service to mining organisations. It also undertakes research on mine safety and health. Other responsibilities include the administration of legislation on the safe utilisation and handling of various gases and legislation providing comprehensive controls over explosives and other hazardous substances.

Thus the Department carries the responsibility for State government supervision to ensure that natural resources are assessed, developed and put to work safely and effectively.

### South Australia

The role of the Department of Mines and Energy is to:

- provide an information service and advice to the government, government agencies, private industry and general public on exploration, development and processing of the State's mineral, energy and underground water resources;
- ensure that the State's mineral, energy and underground water resources are assessed and developed in accordance with government policy;
- encourage private sector exploration for mineral and energy resources in the State;
- provide advice to government on overall energy development, utilisation and conservation, including alternative energy sources;
- ensure that industries engaged in exploring, extracting and processing mineral and energy resources adopt effective safety precautions within their operations;
- ensure that the government's policies on environmental protection measures are adopted by organisations engaged in exploration and development of the State's mineral, energy and underground water resources;
- provide geoscientific research and specialist services as part of an ongoing process of acquiring and updating geological and geophysical data throughout the State for the benefit of the mining industry, other government departments and the community.

### Western Australia

The Western Australian Department of Mines carries out the registration of mining tenement titles, the survey of tenements and the subsequent collection of mining royalties. Through its Geological Survey Division, the Mines Department carries out geological investigations and surveys throughout the State. The results of this work are made available in both map and report format. The Government Chemical Laboratories Division of the Mines Department provides analytical and research services to government, industry and the public. In addition the Department administers legislation relating to the use and transport of explosives and dangerous goods and the safety of workers in the mining and petroleum industries.

### Tasmania

The Department of Mines assists industry in maintaining and increasing the value to the State of its mineral and petroleum resources. Companies are required to extract resources in the most complete manner and to minimise environmental impact. The Department is the State's centre for earth sciences and mineral resources. Mineral resource maps, geological maps, mineral exploration data bases and geophysical information are available.

# MINERAL INDUSTRY

VICTORIA.

**GOLD LICENSE.**

No. 38

1 Oct 1853

The Board

having paid to me the Sum of One Pound Ten Shillings, on account of the Territorial Revenue, I hereby License him to dig, search for, and remove Gold on and from any such Crown Lands within the

Limon on

as I shall assign to him for that purpose during the Month of Oct 1853 from within half-mile of any Head Station.

This License is not transferable, and to be produced whenever demanded by me or any other person acting under the authority of the Government, and to be returned when another License is issued.

*E. J. [Signature]*

Comptroller-General.

**REGULATIONS TO BE OBSERVED BY THE PERSONS LICENSED FOR GOLD OR OTHERWISE REPEATED AT THE GOLD FIELDS.**

- Every Licensed Person must always have his License with him ready to be produced whenever demanded by a Constable, or Person acting under his Instructions, otherwise he is liable to be prosecuted as a trespasser on the Crown Lands.
- Every Person digging for Gold, or otherwise taking a License, is liable to law to be bound, for a Coat of arms, and something else for a named offence, and something else, and for a subsequent offence, but something else.
- Digging for Gold is not allowed within Ten feet of the edge of any Public Road, nor one One Death to be substituted.
- Tools or Machinery are not to be erected within Twenty feet of each other, or within Twenty feet of any Creek.
- It is enjoined that all Persons at the Gold Fields, and near to, shall be subject to the laws and regulations of the Colonies of Victoria.

Nineteenth century gold prospectors.

Iron ore being railed to Dampier.

Working the coal face, Newlands, Queensland.

Stock piles of coal at Hay Point, Queensland.

*Photographs—Promotion Australia.*

Bauxite mine, Gove, Northern Territory.

The following services are provided:

- geological and mining engineering advice;
- engineering geology and groundwater services;
- chemical and metallurgical laboratories;
- drill and plant hire;
- ore dressing research into metallurgical recoveries;
- selection and design of treatment plants.

Financial assistance is extended to approved mining lessees.

### **Northern Territory**

The Department of Mines and Energy encourages and assists the development of an efficient mining and processing industry throughout the Northern Territory. Through five divisions the Department administers relevant legislation and provides a wide range of services.

Mines Division acts as a single point of contact for all mineral mining related matters in the Northern Territory. In this context it is also responsible for controlling and ensuring the efficient, orderly and safe exploration for, and recovery and utilisation of mineral resources in the Northern Territory. The Division formulates and implements policy and legislation designed to investigate the feasibility of mining and development proposals, provides technical advice to prospecting and mining operations, and strives for compatibility between mining and alternate land uses. It also administers all mineral titles and is responsible for the collection of mineral royalties.

The Geological Survey Division provides the essential scientific basis for the overall operations of the Department of Mines and Energy. The Division studies the regional geology and geophysics of the Northern Territory and publishes reports of this work for use by industry, other government departments and the public.

Energy Division is responsible for the development and implementation of energy policies, research into alternative sources of energy, planning of energy supply and consumption in the Northern Territory and for safety and environmental supervision of petroleum exploration. This includes promotion of the exploration for and development of indigenous energy resources, research into diversification of the Northern Territory's energy base, energy conservation and security.

Alligator Rivers Region is responsible for the oversight and coordination of all stages of uranium mining, milling and rehabilitation processes in the Alligator Rivers Region. The unit is the focal point for the industry and the public for matters concerning uranium mines in the Northern Territory.

Administration ensures effective administration of the Department's functions and responsibilities and provides a range of common services to operational divisions.

## **Research**

Research investigations into problems of exploration, mining, ore-dressing and metallurgy are conducted by government bodies, universities, private enterprise, or by the combined efforts of all these. A summary of their functions follows, for further information on research see Chapter 22, Science and Technology.

### **The Australian Mineral Development Laboratories**

Analysis, contract research and consulting in a broad range of scientific and technical areas is carried out by Amdel Limited. Operations are based in Adelaide, with branches in Perth, Melbourne, Sydney, Canberra, Darwin and Townsville. Extensive laboratory facilities are available in the fields of analytical chemistry, mineralogy, materials science and petroleum. Mineral processing testing is carried out at bench and laboratory scale. Services are provided in fields of pollution and environmental control and occupational health and safety. Products are based around nucleonic measurement techniques linked to microprocessors, and include in-stream analysis for the mineral industry, coal slurry analyser, limestone analyser and on-pipe density gauge.

### **Bureau of Mineral Resources, Geology and Geophysics—BMR**

BMR is one of the largest geoscience research organisations in Australia. Its role is to develop an integrated scientific understanding of the geology of the Australian continent, its Territories and offshore areas, as a basis for mineral exploration and resource assessment.

BMR carries out programs in:

- Fossil fuels and minerals research: with components covering Controls on Fossil Fuels Occurrence; Onshore Sedimentary Basins; Offshore Sedimentary Basins; Overseas Basins; Mineral Deposits and Provinces; Regolith, Related Resources and Remote Sensing; Regional Structure and Tectonics; and Geophysical Mapping (Continental and Offshore).
- Groundwater research and assessment: comprising a component on Basin Hydrogeology.
- National geophysical observatories and Antarctic surveys: involving components on Earthquake and Volcanic Hazards; Monitoring of Nuclear Explosions; Geomagnetism; Antarctic Onshore Surveys; and Antarctic Offshore Basins.
- Petroleum and minerals resource assessment: covering components on Petroleum Resource Assessment and Availability; and Mineral Resource Assessment and Availability.
- National geoscience databases: including components on Databases Co-ordination, Research and Operations; and Geoscience Maps, Cartography and Image Processing.
- BMR management and information: with components on Geoscience Management, Co-ordination and Public Relations; Publications; Geoscience Library and Museum; Resources Management and Services; and International Agreements and Project Co-ordination.

### **Commonwealth Scientific and Industrial Research Organisation**

Minerals research by the Commonwealth Scientific and Industrial Research Organisation (CSIRO) is undertaken within the Institute of Energy and Earth Resources. The research has the objectives of improving methods of locating, evaluating, defining and characterising Australia's mineral resources and of planning their recovery, development and effective use consistent with the minimisation of environmental stresses. Divisions of the Institute engaged in minerals research are the Division of Geomechanics at Syndal (Vic.); the Division of Fossil Fuels at North Ryde (N.S.W.); the Division of Mineral Chemistry at Port Melbourne (Vic.); the Division of Mineral Engineering at Clayton (Vic.); the Division of Minerals and Geochemistry at Perth (W.A.), the Division of Mineral Physics and Mineralogy at North Ryde (N.S.W.), and the Division of Energy Chemistry at Lucas Heights (N.S.W.). The Institute Headquarters is located in Canberra (A.C.T.).

### **University research**

The various universities in Australia carry out research into various aspects of the mineral industry such as geology, ore mineralogy and genesis, mining techniques, mineral processing, extractive metallurgy, and materials and metals technology.

### **Research by private enterprise**

The Australian Mineral Industries Research Association Limited (AMIRA) is a non-profit organisation which was set up in 1959 by the Australian mineral industry to manage jointly sponsored research and development on behalf of the industry. There are more than 100 members of AMIRA, drawn from all parts of the mineral, coal and petroleum industries. Membership ranges from small exploration companies to large mining houses and includes suppliers of services to the industry. The policy of the Association is determined by a council elected by members.

AMIRA has no research facilities so organisations such as CSIRO, universities, consultants, suppliers or member companies carry out the research as contractors to AMIRA. Research contracts worth approximately \$13 million are being handled by AMIRA.

### **International relations**

Because Australia is a large supplier of certain minerals to the rest of the world, and because the welfare of the domestic industry depends to a large extent on the maintenance of a high level of exports, international relations are of considerable importance to the industry, and the Commonwealth Government takes an active role in international consultations and discussions relating to minerals. The most important international commitments are discussed below.

## International Tin Agreement

The First International Tin Agreement (of the post-war period) was in operation for five years from 1 July 1956 to 30 June 1961. It was followed by the Second, Third, Fourth, Fifth and Sixth International Tin Agreements, which came into force on 21 February 1962, 21 March 1967, 1 July 1971, 1976 and 1982 respectively. Australia joined the Fourth, Fifth and Sixth Agreements as a 'producing' (i.e. exporting) member, whereas in the first three agreements Australia's status had been that of a 'consuming' (i.e. importing) member. Details of the Second and Third Agreements are given in *Year Book* No. 57, pages 911-12. Details of the Fourth Agreement are given in *Year Book* No. 61, page 942, and those of the Fifth in *Year Book* No. 66, page 376.

Prior to the expiry date of the present (Sixth) Agreement on 30 June 1987, member countries agreed to extend the Agreement for two years from 1 July 1987 to 30 June 1989. During this period of extension, the economic provisions of the Agreement will remain suspended following the cessation of buffer stock operations by the International Tin Council on 24 October 1985.

The Sixth International Tin Agreement is administered by the International Tin Council, which is made up of the following governments: *Producers*—Australia, Indonesia, Malaysia, Nigeria, Thailand, Zaire; *Consumers*—Belgium-Luxembourg, Canada, Denmark, Finland, France, Germany (Federal Republic of), Greece, India, Ireland (Republic of), Italy, Japan, Netherlands, Norway, Poland, Sweden, Switzerland, and the United Kingdom. The producing countries hold a total of 1,000 votes, distributed so that each country receives five initial votes and an additional number corresponding to its percentage as laid down by the Agreement. The consuming countries hold a total of 1,000 votes also distributed so that each country receives five initial votes and an additional number proportionate to quantities consumed. The allocation of votes in each category is periodically reviewed.

## Association of Tin Producing Countries—ATPC

The ATPC came into force on 16 August 1983. Membership is open to countries which are net exporters of tin. The current members are Australia, Bolivia, Indonesia, Malaysia, Nigeria, Thailand, Zaire. The main objective of the ATPC is to encourage greater consumption of tin through research, development and promotion.

## International Lead-Zinc Study Group

With the cessation of stockpile buying of lead and zinc by the United States Government in 1958, world producers were faced with the prospect of a serious imbalance between world supply and demand for these metals. To meet this problem, a series of meetings of interested governments were held at which Australia was represented. These meetings culminated in the formation of the International Lead-Zinc Study Group which was established in January 1960. The Study Group comprises the following governments: Algeria, Argentina, Australia, Austria, Belgium, Bulgaria, Canada, Czechoslovakia, Denmark, Finland, France, Germany (Federal Republic of), Hungary, India, Iran, Ireland (Republic of), Italy, Japan, Mexico, Morocco, Netherlands, Norway, Peru, Poland, South Africa (Republic of), Spain, Sweden, Tunisia, Union of Soviet Socialist Republics, United Kingdom of Great Britain and Northern Ireland, United States of America, Yugoslavia and Zambia. The Group provides opportunities for inter-governmental consultations on international trade in lead and zinc and for studies of the world situation in lead and zinc.

## Association of Iron Ore Exporting Countries—APEF

Australia is a founder member of the APEF whose members account for about 44 per cent of world iron ore exports. Other members are Algeria, India, Liberia, Mauritania, Peru, Sierra Leone, Sweden and Venezuela.

The Association was formed in 1975 with a Secretariat located in Geneva, Switzerland. The Agreement establishing the Association provides for a Conference of Ministers, which meets once every two years. A Board, comprising representatives of each member country meets twice a year.

The objectives of the Association are to promote close co-operation among member countries with a view to safeguarding their interests in relation to the iron ore export industry.

The Association provides a forum for consultations and exchange of information on problems relating to the iron ore export industry.

The Association's Secretariat publishes a statistical bulletin twice a year as well as occasional papers on the iron ore industries of major producing countries.

### **Inter-governmental Council of Copper Exporting Countries—CIPEC**

The CIPEC was established in 1967 by the Governments of Chile, Peru, Zaire and Zambia as an inter-governmental consultative organisation.

Australia and Papua New Guinea were admitted as Associate Members and Indonesia as a Full Member in 1975, the latter changing to Associate Membership from 1 January 1986. Yugoslavia was admitted as an Associate Member in 1977. Associate Members may participate in meetings but have no voting rights and are not bound by CIPEC's decisions.

The key objectives of CIPEC are to co-ordinate measures to achieve continuous growth in real earnings from copper exports and to harmonise the decisions and policies of members relating to copper production and marketing.

### **International Bauxite Association—IBA**

Australia joined the IBA as a founder member in October 1974. Other members are Ghana, Guinea, Guyana, India, Indonesia, Jamaica, Sierra Leone, Surinam and Yugoslavia. Members account for about three-quarters of world bauxite production, with Australia accounting for over one third of world production.

The objectives of the Association are to promote the orderly and rational development of the bauxite industry; to secure for members fair and reasonable returns from the exploitation, processing and marketing of bauxite and its products for the economic and social development of their peoples, bearing in mind the recognised interests of consumers; and generally to safeguard the interests of member countries in relation to the bauxite industry.

The Association consists of a Council of Ministers which meets once a year, an Executive Board consisting of senior officials which meets three times a year and a Secretariat which is located in Kingston, Jamaica.

The IBA provides members with an opportunity to discuss common problems and evolve co-operative policies to facilitate further development of their bauxite/alumina/aluminium industries. The Association's work is mostly concerned with exchanging views and information on a range of industry matters. The commercial and technical aspects of formulating minimum export prices for bauxite and alumina have received particular attention. In November 1986 the Council adopted recommendations on minimum CIF prices for bauxite and alumina sold by member countries in 1987. Australia was not included in the majority that voted for the recommendations and is not bound by them. The Association publishes a quarterly review.

## **Mining industry statistics**

This section contains statistics of the mining industry in Australia, obtained from the annual census of mining establishments. The annual mining census is conducted throughout Australia on an integrated basis with other economic censuses, e.g. the annual census of manufacturing establishments, electricity and gas establishments and the periodic censuses of retail, wholesale trade, construction, transport and selected services establishments.

Statistics are also available for *enterprises* engaged in the mining industry. The latest statistics for mining are in respect of 1984-85 and were published in the *Enterprise Statistics: Details by Industry Sub-division, Australia* (8107.0). Enterprise statistics for mining are now produced annually and should be available within two years of the end of the financial year to which they relate. A description of the statistics and broad summary tables, in respect of the 1983-84 and 1984-85 censuses and surveys are given in Chapter 18.

The following table shows key items of data for establishments in Australia for 1985-86 based on the 1978 edition of the *Australian Standard Industrial Classification* (ASIC).

## MINING ESTABLISHMENTS: SUMMARY OF OPERATIONS BY INDUSTRY CLASS, 1985-86

| Industry<br>ASIC<br>code | Description                                                  | Estab-<br>lish-<br>ments<br>at<br>30 June | Average<br>employ-<br>ment<br>over<br>whole<br>year(a) | Wages<br>and<br>salaries<br>(b) | Stocks          |                 | Total<br>purchases<br>transfers<br>in and<br>selected<br>expenses | Value<br>added |                 |

(a) Includes working proprietors (b) Excludes amounts drawn by working proprietors.

## Mineral production

This section contains details of the output (quantity and value) of selected minerals produced and the metallic content of ores, concentrates, etc.

The statistics shown have been derived from data collected in the annual mining census and in returns to the various State Mines Departments, supplemented in some cases by information made available by the Department of Primary Industries and Energy and from other sources.

For details of the scope of mineral production statistics and their relation to mining industry statistics, and the principles for measuring the output of minerals, see *Year Book* No. 61 and earlier issues.

## Quantity of minerals produced

The following tables show particulars of the quantities of selected minerals produced and contents of selected metallic minerals produced during 1985-86 and earlier years. Further data are available relative to all minerals in the annual publication *Mineral Production, Australia* (8405.0).

## QUANTITY OF SELECTED MINERALS PRODUCED

(a) Includes alluvial gold. (b) Includes ilmenite from which titanium dioxide is not commercially extractable and beneficiated ilmenite. (c) Partly estimated.

### Foreign participation in the mining industry in Australia

Summary information on foreign participation in the mining industry in Australia is shown in Chapter 26, Foreign Transactions. More detailed statistics are available in *Foreign Ownership and Control of the Mining Industry, Australia 1984-85* (5317.0) and *Foreign Control in Mineral Exploration, Australia 1984-85* (5323.0).

### Mineral exploration (other than for petroleum and oil shale)

#### Definition

Exploration consists of the search for and/or appraisal of new ore occurrences and known deposits of minerals (including extensions to deposits being worked) by geological, geophysical, geochemical and other methods (including drilling). Exploration for water is excluded. The construction of shafts and adits is included if primarily for exploration purposes. Excluded are mine development activities carried out primarily for the purpose of commencing or extending mining or quarrying operations (including the construction of drives, shafts, winzes, etc. in underground mines, and the preparation of quarrying sites, including overburden removal, for open-cut extraction).

#### Sources of statistics

The statistics of exploration for minerals *other than petroleum and oil shale* are derived from the annual mineral exploration census conducted by the Australian Bureau of Statistics in each State and the Northern Territory (in New South Wales the census is conducted jointly with the State Department of Mineral Resources).

#### Classification

The data obtained in the mineral exploration census are divided into the following categories:

(a) *Private exploration on production leases*—relates to exploration carried out on the production lease by privately-operated mines currently producing or under development for the production of minerals.

(b) *Other private exploration*—relates to exploration carried out by private enterprises on areas covered by exploration licences, authorities to enter, authorities to prospect and similar licences and authorities issued by State governments for exploration of minerals. Also included is exploration by private enterprises which is not directly connected with areas under lease, licence, etc.

(c) *Exploration by government*—relates to exploration of minerals carried out by Federal and State government departments, local government authorities and business undertakings operated by those departments or authorities.

## Expenditure, metres drilled

The following table shows expenditure and metres drilled on private mineral exploration other than for petroleum and oil shale in Australia during the last six years.

### PRIVATE MINERAL EXPLORATION (OTHER THAN FOR PETROLEUM AND OIL SHALE)

## Oil shale exploration

Statistics of exploration for oil shale are derived from an annual exploration census conducted by the Australian Bureau of Statistics.

In 1985-86 expenditure in Australia on private exploration for oil shale amounted to \$1,780,000 with 3,000 metres being drilled.

## Petroleum exploration

### Source of statistics

These statistics of expenditure on petroleum exploration have been obtained by the addition of values collected in a quarterly census conducted by the Australian Bureau of Statistics. Other data shown were collected by the Bureau of Mineral Resources, Geology and Geophysics. Further information relating to petroleum exploration is published by the Australian Bureau of Statistics in its annual publication *Mineral Exploration, Australia* (8407.0) and by the Bureau of Mineral Resources, Geology and Geophysics in *The Petroleum Newsletter* (issued quarterly) and *The Australian Mineral Industry Annual Review*.

### Scope

Petroleum exploration consists of the search for and/or appraisal of deposits of crude oil and/or natural gas and natural gas liquids by geological, geophysical, geochemical, and other exploration methods, including drilling. Included in the expenditure are the costs of drilling exploratory oil and/or gas wells and the testing of such wells. Also included are the costs of access roads, site construction, permits, licences and similar fees, relevant office buildings and furniture, transportation equipment, storage facilities, plant and equipment, and review work where these are undertaken primarily for purposes of exploration for deposits of petroleum. Details of developmental oil and/or gas wells are excluded.

### PETROLEUM EXPLORATION

|                                                                         |               | 1983-84        | 1984-85        | 1985-86        |

## Mineral processing and treatment

The extraction of minerals from ore deposits, as in mining and quarrying, is only a part of mineral technology, as few minerals can be directly used in the form in which they are mined. In most cases, minerals must undergo considerable processing and treatment before utilisation.

### Principal products

The following table shows particulars of the production of certain important manufactured products of mineral origin during recent years.

#### PRODUCTION (a) OF PRINCIPAL MANUFACTURED PRODUCTS OF MINERAL ORIGIN

| Commodity                                 |             | 1982-83 | 1983-84 | 1984-85 |

(a) Some products exclude production of single establishment manufacturing establishments employing less than four persons and production of establishments predominantly engaged in non-manufacturing activities but which may carry on in a minor way, some manufacturing. (b) Excludes secondary metal with the exception of pig iron and steel ingots. *Source:* Bureau of Mineral Resources, Geology and Geophysics (non-ferrous and precious metals only). (c) Metallic content. (d) Newly-won gold of Australian origin. (e) Includes double and triple superphosphate and ammonium phosphate expressed in terms of single superphosphate, i.e. 22% P<sub>2</sub>O<sub>5</sub> equivalent.

## Overseas trade

### Exports and imports

For particulars of the quantities and values of the principal minerals and products exported from and imported into Australia during recent years, see Chapter 26, Foreign Transactions.

Considerable quantities of metallic ores, concentrates, slags, and residues are exported from Australia for refining overseas. The following table shows selected items exported during 1986 and their principal metallic content as estimated by assay.

**PRINCIPAL METALLIC CONTENTS OF SELECTED ORES AND CONCENTRATES ETC.  
EXPORTED FROM AUSTRALIA, 1986**

| Ores and concentrates,<br>etc.              | Metallic contents—estimated from assay |                |                |              |               |                    |              |                |
|---------------------------------------------|----------------------------------------|----------------|----------------|--------------|---------------|--------------------|--------------|----------------|
|                                             | Copper                                 | Lead           | Zinc           | Tin          | Iron          | Tungstic<br>oxides | Gold         | Silver         |

(a) Includes copper matte, copper slags and residues and copper-lead dross and speiss.

## REVIEW OF RECENT DEVELOPMENTS IN THE AUSTRALIAN MINERAL INDUSTRY

(Source: Bureau of Mineral Resources, Geology and Geophysics)

Major recent developments in the Australian mineral industry are reviewed briefly in subsequent parts of this section. Additional information on developments in the industry is available in *Australian Mineral Industry Annual Review 1985* published by the Bureau of Mineral Resources, Geology and Geophysics. That publication contains comprehensive reviews of mineral commodities of importance to the Australian economy, as well as a general review of the industry's performance during the year. The *Australian Mineral Industry Quarterly*, Volume 39, Number 4, details Australia's identified mineral resources, 1986.

### General review of 1986

The Gross Domestic Product (GDP) of Australia in 1985–86 was \$238,939 million, of which an estimated \$15,275 million was generated by the mining industry, excluding smelting and refining. If smelting and refining were included, an estimated \$3,200 million could be added to this figure, thus making the mineral industry the largest primary sector contributor to the GDP.

The ex-mine value of mine production in Australia in 1986 was \$19,720 million. This was \$2,387 million, or 11 per cent, less than the record ex-mine value of \$22,107 million established in 1985, and was the first fall for 25 years. The decrease in 1986 was mainly attributable to a fall in the value of petroleum products, from \$10,098 million to \$6,420 million, caused principally by the collapse of world crude oil prices. Despite the overall decrease, there were substantial increases in the ex-mine values of gold, black coal, diamonds and uranium. Apart from petroleum, the only major commodities to suffer significant falls were nickel, lead and manganese.

### **Imports—1986**

The value of mineral imports has traditionally been dominated by crude oil although over the last two years that domination has weakened. In 1986, imports of crude oil fell by 36 per cent to \$966 million; however this still represented 63 per cent of the total mineral import bill of \$1,535 million which was down 24 per cent compared to 1985. Other significant mineral imports included phosphate rock, gold bullion, elemental sulphur and diamonds. Imports of mineral primary products in 1986 accounted for 4.3 per cent of the total value of merchandise imports compared with 5.9 per cent in 1985. Australia's mineral balance of trade (value of mineral exports minus value of mineral imports) was a record \$13,276 million in 1986, marginally ahead of the 1985 balance of \$13,238 million.

### **Exports—1986**

The value of mineral exports fell slightly (3 per cent) to \$14,811 million in 1986 compared to \$15,262 million in 1985. Major minerals to show gains on their 1985 levels included aluminium, black coal, diamonds, gold, lead, mineral sands and uranium. Decreases were recorded for copper, crude oil, iron ore, LPG, nickel, tin and zinc among the major minerals.

Black coal remains the largest single export earner, accounting for \$5,364 million or about 36 per cent of the total value of mineral primary products exported. Iron ore was the second largest with a value of \$1,938 million (a decrease of 3 per cent compared to 1985) followed by alumina which was virtually steady at \$1,427 million, and aluminium metal, \$975 million (an increase of 13 per cent over the 1985 value). These four minerals together account for about two-thirds of the total value of mineral primary products exported. A significant contribution was also made by copper, crude oil, gold, lead, LPG, mineral sands, nickel, uranium and zinc.

### **Pattern of mineral trade—1986**

During 1986, Australia exported minerals to more than 100 countries. Japan accounted for 41 per cent of these exports by value, about the same as in 1985. Principal mineral products exported to Japan included alumina, aluminium metal, black coal, copper, gold, lead, mineral sands, nickel and zinc.

The E.E.C. accounted for 17.7 per cent (including 4.6 per cent to the U.K.) of Australia's mineral exports. Major items comprised black coal, copper, iron ore, lead, mineral sands, uranium and zinc. U.S.A. accounted for a further 9.9 per cent consisting mainly of alumina, bauxite and nickel.

### **Bauxite, alumina and aluminium**

In 1986, production of bauxite increased by 2 per cent to 32.4 million tonnes, alumina production increased by about 7 per cent compared with 1985, while aluminium production increased by 4 per cent to 881,910 tonnes. Australia was again the world's largest producer of bauxite and alumina.

In Western Australia all bauxite production is refined at either Alcoa's refineries at Kwinana, Pinjarra and Wagerup, or at Worsley refinery. In the Northern Territory bauxite not exported is refined at Nabalco's refinery at Gove, Northern Territory. In Queensland about 70 per cent of Weipa bauxite is refined at Gladstone (Queensland) and the balance exported.

Gladstone supplies alumina to Comalco's Boyne Island smelter, Queensland (207,000 tonnes per year capacity), to Alcan's Kurri Kurri smelter, New South Wales (capacity 150,000 tonnes per year), to the Bell Bay, Tasmania smelter (117,000 tonnes per year capacity) and to the Tomago, New South Wales (230,000 tonnes per year capacity). Tomago also receives alumina from Gove. Australia's remaining smelters, Point Henry (capacity 165,000 tonnes per year) and the newly opened Portland smelter (capacity 150,000 tonnes per year) are both in Victoria and receive alumina from Western Australia.

### **Copper**

A summary of the copper mining industry in Australia 1953 to 1975 and the sufficiency of present ore reserves was published in the *Australian Mineral Industry Quarterly*, Vol. 30, No. 1.

In 1986 mine production of copper decreased by 4 per cent to 248,496 tonnes because of lower output from Warrego in the Northern Territory, the Mount Gunson mine in South Australia which ceased operations around mid-year and Teutonic Bore in Western Australia where milling operations ceased in the first half of the year. Production of primary blister copper increased slightly to 168,855 tonnes although production of primary refined copper declined slightly to 162,604 tonnes. Construction began on the Olympic Dam Project in South Australia in March 1986 and production from the first phase of the project is planned to begin around mid-1988. Annual production of about 30,000 tonnes of refined copper, 2,000 tonnes of  $U_3O_8$  and about 2,800 kilograms of gold is planned.

### Gold

In 1986, Australia's gold production increased for the sixth successive year, reaching 73,817 kilograms, the highest since 1913. During the year, 29 new gold mines were commissioned and plans were made to bring another 41 prospects to production in the future. Australia was the fourth ranking gold producer in the Western world in 1986.

### Iron

A summary of growth of the Australian iron ore industry 1965 to 1975 was published in the *Australian Mineral Industry Quarterly*, Vol. 29, No. 1.

Production of iron ore in 1986 decreased by 4 per cent to 94.0 million tonnes. Substantial decreases in output at Pannawonica, Paraburdoo, Tom Price and Yampi Sound, were partially offset by increased production at Shay Gap, Middleback Range and Newman. Exports of iron ore and iron ore pellets also fell by 8 per cent to 79.7 million tonnes. Shipments of iron ore and pellets for consumption in domestic ironmaking and steelmaking increased to 9.3 million tonnes in 1986. Australia was the world's fourth largest producer, and continued to be the second largest exporter, after Brazil.

The Broken Hill Proprietary Co. Ltd (BHP) announced in 1986 that it planned to develop its limonite resources at Yandicoogina, 100 kilometres north-west of Newman. Resources which are close to the Newman-Port Hedland rail link are estimated at about 1,800 million tonnes. In 1986, CRA Ltd acquired a 50 per cent share in CSR Ltd's Yandicoogina deposits and the agreement provided access to Hamersley Iron's existing iron ore infrastructure. This lease, which is adjacent to BHP's holdings, is estimated to contain 3,000 million tonnes of limonite.

Goldsworthy Mining Ltd announced details of plans to invest \$87 million, to enable an extension of its mining activities in the Shay Gap area for a further twenty years.

### Silver, lead and zinc

Mine production of lead (449,427 tonnes) and zinc (694,472 tonnes) declined in 1986, largely because of the closure of the major Broken Hill mines in mid-year because of industrial disputes.

Production of primary refined zinc increased slightly in 1986, but the production of primary refined lead fell sharply because fewer concentrates were available as a result of the Broken Hill industrial dispute. Lead metal production including secondary was 171,039 tonnes and zinc metal production including secondary was 307,615 tonnes.

Detailed exploration of a number of deposits continued in 1986. These included Hilton, Lady Loretta, Thalanga, Lione town and Conjuboy, all in Queensland; Scuddles, Blende vale, Cadjebut and Twelve Mile (Lennard Shelf) in Western Australia; Benambra, Victoria and Hellyer in Tasmania.

### Black coal

Raw black coal production in 1986 was a record 169.9 million tonnes, 7 per cent higher than in 1985. The output of saleable coal rose by 7 per cent to the record level 139.1 million tonnes. Domestic consumption rose to the record level of 43.4 million tonnes in 1986, mainly due to the growth in use by the electricity industry. Exports rose by 5 per cent to 92.0 million tonnes in 1986 and the value of exports rose to \$5,327 million. Of total exports 41.9 million tonnes were shipped to Japan. Australia was the world's leading coal exporter in 1986.

Demand for steaming coal on the international market has remained high. As a result Australian exports of steaming coal rose to 43.3 million tonnes in 1986. Downturn in the world's steel industry in 1985 and 1986 caused Australian exports of coking coal to fall by 2 per cent in 1986 to 48.7 million tonnes.

Papers dealing with the Australian coal industry have been published in the *Australian Mineral Industry Quarterly*, Vol. 31, No. 1 and Vol. 34, No. 2.

## Petroleum

At the end of 1986 there were 101 fields producing stabilised crude oil, which is 25 per cent more than in 1985 (81 fields). In 1986 production of crude oil fell by 12.3 per cent to 27.7 million cubic metres compared to the 1985 record level of 31.6 million cubic metres. The production of natural gas and condensate rose by 9.2 per cent and 10.7 per cent respectively.

Total refinery input declined by 2.6 per cent and the proportion of total input from indigenous sources decreased from 80 per cent in 1985 to 77 per cent in 1986. Consumption of automotive gasoline (motor spirit) decreased by 3.2 per cent. Consumption of all other major petroleum products except automotive diesel oil and aviation turbine fuel also decreased. The quantity of imported crude oil, enriched crude oil and other refinery feedstock increased by 18.4 per cent in 1986 compared with that in 1985, however its value decreased by 28.3 per cent from \$2,133 million to \$1,531 million. Total exports of petroleum products fell in value in 1986 by 45.5 per cent to \$1,797 million, compared to \$3,300 million in 1985.

The number of exploration wells drilled decreased from 270 in 1985 to 139 (111 onshore, 28 offshore) in 1986, and total metres drilled for exploration decreased from 512,112 m in 1985 to 275,256 m in 1986, a decrease of 46.3 per cent. Geophysical exploration also decreased during 1986. Offshore exploration resulted in one oil, two gas and two oil and gas discoveries, and two gas/condensate discoveries. Onshore exploration produced fifteen oil, ten gas, five oil and gas discoveries, and seven gas/condensate discoveries. Development drilling in 1986 was below the level achieved in the last 5 years. The total of 37 development wells drilled was 61 per cent less than in 1985 (94 wells). Onshore drilling (17 wells) was down 78 per cent compared with 1985 (76 wells), and offshore drilling (20 wells) was marginally more than for 1985 (18 wells). Development wells were drilled offshore at Flounder (7), Snapper (5), Fortescue (3), and at North Rankin (5) platforms.

In 1986 there was a rapid decline in world oil prices followed by a slow recovery to about three quarters of the early 1985 value. In spite of this, several new developments proceeded during 1985 and 1986, the largest being the start of construction of the Liquefied Natural Gas (LNG) export phase of the North West Shelf gas project, designed to supply LNG to Japan commencing in 1989. The construction of a 1,500 kilometre gas line linking the Palm Valley and Mereenie fields to supply gas to the Channel Island power station in Darwin was another major development. In the Bass Strait Flounder, Snapper, Cobia and Fortescue development drilling proceeded, and the Bream platform was installed. Development drilling of the field from this platform commenced in 1987. Other significant developments in 1985 and 1986 were the installation of facilities, development drilling and initiation of production at the Jabiru and Harriet oil fields, and the development drilling of Palm Valley and Mereenie fields.

In Queensland, plants to extract liquids from gas were built at Kincora and Wallumbilla in the Surat Basin, and a small refinery was built at Eromanga to supply products locally, using oil from nearby fields as feedstock. The township of Warrnambool in Victoria was connected to the North Paaratte gas field, and an oil pipeline was constructed to connect Alice Springs to the Mereenie oil and gas field.

Plans are being formulated for the development of the Challis, Saladin, and North Herald/South Pepper offshore fields in Western Australia.

The Centre for Petroleum Engineering Studies was established at the University of New South Wales. This is the first Australian institution which will provide graduates in Petroleum Engineering to the industry.

Economic and sub-economic demonstrated resources of crude oil at 31 December 1986 were 262 gigalitres, a decrease from the previous figure of 289 gigalitres at the end of 1984. Economic and sub-economic demonstrated resources of gas increased to 2,089,000 million cubic metres. Expenditure on petroleum exploration decreased 22 per cent from \$750.0 million in 1985 to \$586.8 million in 1986.

## Nickel

Mine production of nickel in ore and concentrates was an estimated 78,000 tonnes in 1986. Australia was the third largest world producer after Canada and U.S.S.R. Concentrates produced in Western Australia are smelted at the Kalgoorlie nickel smelter. Some of the matte produced is railed to the Kwinana nickel refinery to be refined to nickel metal and the remainder is exported. Nickel-laterite ore mined at Greenvale, Queensland, is treated at the Yabulu nickel treatment plant to produce nickel oxide sinter for export.

## Mineral sands

The history of the mineral sands industry is presented in the *Australian Mineral Industry Quarterly*, Vol. 25, No. 1, and updated in the Proceedings of the Australasian Institute of Mining & Metallurgy, Symposia Series, No. 46.

Australia is still the world's largest producer and exporter of natural rutile, ilmenite, zircon and monazite. Output of concentrates in 1986 were: rutile production 220,046 tonnes, ilmenite 1,291,349 tonnes, zircon 419,290 tonnes and monazite 10,583 tonnes.

## Diamonds

Commercial production of diamonds from the alluvial deposits in the Upper Smoke Creek and Limestone Creek alluvials and from the scree deposits overlying the AK-1 Kimberlite pipe at Argyle commenced in January 1983; the alluvial and scree deposits were mined out in 1985. In its first year of full scale mining of the AK-1 pipe, Argyle Diamond Mines Pty Ltd produced 29,210,764 carats of diamonds in 1986, easily exceeding production from any other mine in the world, or for that matter, the annual production from any country. Diamonds from the AK-1 pipe comprise about 6 per cent gem, 39 per cent cheap gem and about 55 per cent industrial grades.

## Uranium

Preliminary estimates of production of uranium in Australia in 1986 amounted to 4,899 tonnes of  $U_3O_8$  (4,154 tonnes contained U) 30.0 per cent greater than in 1985. Exports for 1986 were 4,166 tonnes of  $U_3O_8$  (preliminary estimates only).

## HISTORICAL DEVELOPMENT OF THE AUSTRALIAN MINERAL INDUSTRY

*(This special article has been contributed by the Bureau of Mineral Resources—written by  
I. R. McLeod)*

The history of the Australian mineral industry began with the first European settlement when settlers quarried stone and dug clay for bricks for their buildings. The industry since then has had its booms and depressions, but from the discovery of gold at least, it has been an important contributor to the Australian economy. It provides the nation's basic industrial requirements—construction materials, fuel, and industrial raw materials; it has facilitated decentralisation of both population and industry, as towns, railways and ports were established to serve the mines and smelters; it has encouraged technological advancement, both in its own and other, unrelated, fields; and it has been a major earner of export income.

The industry has created wealth for the nation and its people through the discovery and mining of mineral deposits and processing the ore. It now produces some 65 different mineral commodities with an annual value of mine production ranging up to more than \$5,000 million in the case of coal. Australia is one of the world's leading miners of bauxite (the ore of aluminium), diamonds, gold, iron ore, lead, manganese ore, nickel, titanium (rutile and ilmenite), tungsten, zinc and zircon. It mines, or has unworked deposits of, almost all mineral commodities—of the major mineral raw materials it now lacks only sulfur. Some commodities, such as petroleum and aluminium, have had a relatively short production history in Australia; others, such as the base metals, iron ore, and, especially, coal, go back to the early days of the industry.

### AUSTRALIAN ECONOMIC DEMONSTRATED RESOURCES, MAJOR MINERAL COMMODITIES

(Mt unless otherwise indicated)

| Commodity                                   | Pre 1965(a)    | 1975    | 1985    |
|---------------------------------------------|----------------|---------|---------|
| Bauxite . . . . .                           | 21(1954)       | 3,000   | 2,889   |
| Black coal (recoverable) . . . . .          | (b)4,276(1962) | 19,500  | 34,000  |
| Brown coal (recoverable) . . . . .          | 17,000(1960)   | 12,600  | 41,900  |
| Copper (kt) . . . . .                       | 1,300(1960)    | 5,900   | 16,100  |
| Diamond (10 <sup>6</sup> carat)             |                |         |         |
| gem . . . . .                               | —              | —       | 187     |
| industrial . . . . .                        | —              | —       | 229     |
| Gold (t) . . . . .                          | 250(1960)      | 156     | 959     |
| Iron ore . . . . .                          | 374(1959)      | 17,800  | 16,220  |
| Lead (kt) . . . . .                         | 4,300(1960)    | 13,900  | 14,500  |
| Manganese ore . . . . .                     | <2(1962)       | 490     | 326     |
| Nickel (kt) . . . . .                       | —              | 1,900   | 1,700   |
| Petroleum (10 <sup>6</sup> m <sup>3</sup> ) |                |         |         |
| crude oil . . . . .                         | —              | 243     | 231     |
| natural gas . . . . .                       | —              | 326,100 | 691,000 |
| Silver (kt) . . . . .                       | 7(1960)        | 24      | 31      |
| Tin (kt) . . . . .                          | (c)28(1960)    | (c)332  | 262     |
| Titanium (concentrate)                      |                |         |         |
| ilmenite (kt) . . . . .                     | (d)3,500(1955) | 58,400  | 41,400  |
| rutile (kt) . . . . .                       | 2,500(1955)    | 9,200   | 8,000   |
| Uranium (recoverable) (kt) . . . . .        | n.a.           | 300     | 470     |
| Zinc (kt) . . . . .                         | 4,000(1960)    | 19,300  | 21,200  |
| Zircon (kt) (concentrate) . . . . .         | 2,900(1955)    | 15,700  | 11,500  |

(a) Only partly on same basis as later years. (b) Excludes Victoria, where reserves were small. Not specified whether in situ or recoverable. (c) Recoverable; in situ resources estimated to be about 20 per cent higher. (d) Not suitable for pigment production.

## Coal

It is not surprising that coal was the first mineral, other than those used for construction, to be found, because seams crop out along the coast to the north and south of Sydney. Coal was first discovered in the Newcastle area by escaped convicts in 1791. Mining began near Newcastle in 1799, and in 1800 coal became the first mineral exported from Australia.

Production increased steadily from the 1830s onwards, and in the mid-1920s Australian production was almost 14 Mt, but the depression of the 1930s saw it fall by over a third of this amount. Renewed growth faltered in the late 1940s. Exports, which normally exceeded 1 Mt/year until the mid-1920s, had fallen to about 50,000 t by the late 1940s because of increasing competition. At that time also, petroleum products began to replace coal in industry and railways, and these trends were exacerbated by prolonged industrial unrest.

It was widely agreed then that coal would be of diminishing importance as a major mineral commodity. However, measures taken to improve the efficiency of mining, realisation of the economic importance of near-surface seams in the Bowen Basin in Queensland, and the emergence of large markets for coking coal in Japan particularly, brought about a resurgence in the industry. Exports began to increase rapidly in the mid-1950s, and, with impetus added by the oil shocks of the 1970s, Australia became the world's largest coal exporter, with exports reaching 88 Mt in 1985.

The pattern of production changed also. In 1950, New South Wales provided 75% of the total production and Queensland, 14%. In 1985, the two States provided 47% and 49% respectively, and exports from the two were about equal, 68% of the total Australian production being exported. Despite its changing fortunes, the coal industry has been a major sector of the mineral industry for 150 years. The rapid increase in exports in the 1960s consolidated its pre-eminence; in 1985 coal contributed 24% of the total value of ex-mine production in Australia, represented about a third of the industry's total assets, and provided 16% of total Australian merchandise exports.

## Minerals

In the circumstances at the time, the early settlers were little interested in minerals. Traces of gold were reported from 1823 onwards, and occurrences of other metals were reported from time to time. The first metalliferous mining was of silver-lead, at Glen Osmond near Adelaide, in 1841. Copper mining began at Kapunda, in the same general area, in 1842, and at Burra, to the north, in 1844. At the end of the same decade, the first pig iron was produced from a small deposit of iron ore near Mittagong, New South Wales.

It was the discovery of payable alluvial gold in 1851 near Bathurst in New South Wales and, soon after, the rich Victorian fields, that gave impetus to the metalliferous sector of the mineral industry. As search and discovery quickly spread to other parts of eastern Australia, the migrants which the gold attracted, the infrastructure which resulted, and realisation of the mineral potential of the young country, all profoundly influenced the development of Australia from the 1850s onwards.

The wealth created by the newly-mined gold and the influx of migrants began the transition away from an agricultural and pastoral economy. As industries were established to supply the machinery and transport facilities needed by the mines, service industries expanded to cater for increasing population and growing commercial activities.

Gold was the prospectors' prime target for many years after 1851, and the Victorian discoveries were followed by many others around the continent, though few were so rich. Many of the new gold-fields were abandoned as the shallow surface alluvials were exhausted, but on some, especially in Victoria, mining progressed to the deep leads—alluvial deposits covered by tens of metres of later sediments or by lava flows.

Prospecting on some fields discovered primary gold lodes rich enough to be worked. But working such lodes necessitated deep shafts and machinery and treatment plants, and these required capital. The individual miner or syndicate was replaced by companies, employing dozens or even hundreds of men. Towns were established and, as confidence in the long life of the mines increased, tents and shanties gave way to more permanent private and commercial buildings. When, decades later, the mines did start to peter out, many such towns survived because they had become centres for the surrounding agricultural and pastoral industries, or were at convenient points on well established transport routes.

The interest and expertise in prospecting aroused by gold soon led to discoveries of other metals. Tin mining began almost simultaneously in 1872 at Inverell, New South Wales, Mount Bischoff, Tasmania, and Stanthorpe, Queensland. With the discovery soon after of

other fields, especially Herberton in North Queensland, Australia became the major world source of tin in the late 1870s and early 1880s. Base metals were discovered at many places, including Moonta-Wallaroo, South Australia, Zeehan-Dundas and Mount Lyell, Tasmania and Cobar, New South Wales, and Mount Morgan, Queensland. The fabulous Broken Hill lode, whose profits spawned a variety of industries, including steel at Newcastle in 1915, was discovered in 1883.

By the beginning of the twentieth century, the metalliferous mining industry, with associated smelters and refineries, was well established. Gold was still pre-eminent, accounting for three quarters of the total value of metalliferous mine production, with copper, lead and silver accounting for most of the remaining quarter.

Like the goldfields, each mine needed a town for its workers, engineering and machinery suppliers and transport facilities—including ports to ship its products to other parts of the world. Many towns in existence today owe their foundation to a mineral deposit found in the last four decades of the nineteenth century.

The industry continued to prosper in the early years of the twentieth century. However, it was severely affected by the collapse of metal prices after the ending of World War I. Many mines closed, and the value of mineral exports fell from \$15.3 million in 1919–20 to \$7.6 million in 1921–22.

In the late 1930s the mineral industry, although well established, played a minor role in the Australian economy. The need for new ore reserves of many minerals was the major concern of the industry in the late 1930s and early 1940s. Indeed, the forty-year drought of new discoveries, after the flood of the previous century, led some to the belief that there were few new resources to be found, and that the industry would gradually run down. An embargo was placed on the export of iron ore in 1938 by the Commonwealth Government, when reserves of high-grade ore were believed to be no more than 260 Mt. Few new mineral deposits were found from the beginning of the century until after World War II.

In the late 1940s there began a series of discoveries that was to completely change the structure of the industry and elevate Australia to a major mineral exporting country. In the 1950s the mainstays of the industry were lead, zinc, copper, gold, and coal, and only the first four were exported in any quantity. By the late 1960s Australia was a world force in aluminium, coal, iron ore, nickel, manganese, titanium, uranium and zirconium as well as the traditional lead and zinc.

The reason for the surge of discoveries is manifold. Some of the 'new' deposits had been known previously, but were not economically workable. The economics of working such deposits changed remarkably because of technological advances which lowered the cost of mining and transporting huge quantities of material, but these advances would not have been decisive without the emergence of Japan as a major buyer of coal, iron ore and bauxite.

The discovery of new ore bodies close to former mines and the striking of the many new deposits was aided by the development of geochemical and geophysical exploration methods suited to Australian conditions. Many techniques developed in the northern hemisphere were not successful in the arid, deeply weathered terrain characteristic of most of Australia. However, these techniques were modified and new ones developed, and Australia is now a world leader in expertise for mineral exploration in arid regions.

Apart from Japan's economic growth, the expansion of the world economy in the 1950s and 1960s meant an ever increasing demand for minerals. Australia, with its well established industry, had the experience needed to find and develop the new deposits needed to meet this demand.

The greatly increased knowledge of the geology of Australia resulting from systematic geological and geophysical studies led to a better understanding of the geological evolution of the continent. Mineral explorers were able to search more efficiently by using geological theories on the origin of mineral deposits to target specific areas for concentrated exploration. The better understanding showed also that Australia had a high potential for the discovery of mineral deposits. This realisation, together with Australia's political stability, led to an influx in the early 1960s of major overseas mining companies who, in addition to increasing exploration expenditure, brought in new expertise and ideas.

The search for a variety of minerals in diverse geological conditions has developed a highly experienced mineral exploration industry which has begun exporting its skills to other parts of the world.

## Petroleum

The 1960s saw also the discovery of economic accumulations of what had been Australia's most serious mineral deficiency—petroleum.

Although it had been sought for many years, petroleum (which includes crude oil and natural gas) was a latecomer to the mineral production scene in Australia. However, it has made up for lost time and has become one of Australia's major mineral products in terms of value of production; and in 1985, following a change in government policy on petroleum exports, it was Australia's second most valuable mineral export.

Hydrocarbons, in the form of crude bitumen, were first recorded in 1839, at the mouth of the Victoria River, near the Western Australia-Northern Territory border. The first well drilled specifically for petroleum was put down in 1882 at Alfred Flat, in the Coorong area of South Australia. However this well, and several others in the same general area, did not encounter any oil.

In 1900, at Roma in Queensland, natural gas was encountered in an artesian water bore which was being deepened. Gas continued to flow freely from the well and in 1906 it was reticulated for town lighting; however, the flow failed after 10 days. This discovery marks the real beginning of petroleum exploration in Australia. Many wells were drilled subsequently in the Roma region; some encountered small quantities of oil or gas.

The first substantial flow of oil was in 1953 from the Rough Range No. 1 well in the north-west of Western Australia. However, a commercial field did not eventuate, and the interest in petroleum exploration aroused by the discovery began to wane. Because of the economic and strategic advantages of an indigenous supply of petroleum, the Commonwealth Government had encouraged the search for it since soon after World War I. With the increasing importance of petroleum and petroleum products to the Australian economy, the Government in 1957 adopted several measures, including a subsidy for specific approved operations, to encourage petroleum exploration. These measures did much to re-encourage exploration.

Australia's first commercial oil field was discovered at Moonie, 200 km south-east of Roma, in 1961. A pipeline was built to Brisbane, and commercial production began in 1964. 1964 marked several other important events: the discovery of oil and gas at Barrow Island, Western Australia; of gas in what has become a cluster of oil and gas fields in north-west South Australia and the adjoining part of Queensland; and the most important of all, the discovery of gas some 25 km off the Gippsland coast in Australia's first offshore well. The Gippsland shelf fields now supply three quarters of the crude oil and nearly half of the natural gas produced in Australia.

The Gippsland Shelf discovery, as well as becoming Australia's main source of oil and gas, also turned attention to Australia's extensive continental shelf, and 1971 saw the discovery of the huge gas fields of the North West Shelf which, in addition to supplying Western Australia, will begin to feed one of the world's few liquefied natural gas export projects at the end of the 1980s.

In the early 1970s, petroleum exploration again began to languish—indications from exploration were that onshore oilfields probably would be small and hence unlikely to be economic. However, the oil shocks of 1973 and 1979, when oil prices increased several-fold, completely changed the economics of the industry. Expenditure on exploration increased rapidly, from \$49 million in 1976 to \$948 million in 1982. Some known fields, such as Palm Valley and some Bass Strait fields, were developed, and many new fields were discovered, especially in south-west Queensland and the adjoining part of South Australia.

While exploration has been primarily for oil, it has discovered large resources of natural gas. Indeed, indications are that geological conditions in Australia in the past have favoured the formation of gas rather than oil. Natural gas contributed 19 per cent of total Australian energy consumption in 1985.

Most Australian crude oils are 'light', and oil still has to be imported to supply heavy fractions needed for lubricating oils, bitumen, etc. In 1985, 96 per cent of Australia's crude oil requirement was met by domestic production. However, unless major new discoveries are made, Australia's crude oil self sufficiency will begin to decrease as production from some existing fields declines. Natural gas supplies, however, are adequate for many years, although resources are unevenly distributed around the continent.

## Twenty years of growth

In the mid-1960s, the Australian mineral industry began to expand with growth in both production and exports and the relative importance of the various commodities changed. The relative importance of gold and the base metals declined, while coal, iron ore and 'other minerals' increased in relative importance.

In 1965, industry spent \$22 million on mineral exploration, and \$48 million on petroleum exploration. These amounts had increased to peaks of \$576 million in 1981-82 on mineral exploration, and \$948 million in 1982 on petroleum exploration. Allowing for inflation these peaks represent a multiplication of exploration effort of seven times for minerals and five times for petroleum.

The Australian manufacturing industry, despite its growth, absorbed only a small part of the greatly increased mineral production, and the proportion of production exported (in either raw or processed form) increased greatly in the late 1960s and early 1970s. The index of mineral output at constant prices for 1985 was almost 6 times that for 1965, while the 1985 index of exports of metals and minerals at constant prices was over 11 times the 1965 figure. These exports relieved the pressure on the Australian balance of payments but also made the industry dependent on the health of the world economy.

The destination of exports changed between 1965 and 1985. In 1965, 41% of Australia's mineral exports went to Europe (and 24% of total exports were to the United Kingdom); 41% went to Asia (32% of the total going to Japan); and 16% went to America. In 1985, the corresponding figures were 14% (4%); 63% (41%); and 12%. In 1985 mining, smelting and petroleum production contributed 8% of the Australian GNP, was responsible for 16% of private fixed capital expenditure, and employed 132,000 persons.

In the early 1980s, lower mineral prices resulting from decreased world demand for minerals caused a drastic decline in the Australian industry's profitability; which was only 2.2 per cent of shareholders funds in 1981-82. Measures to increase efficiency, including mining higher grade ores, work-force reductions and changed work practices, and, in a number of cases, mine closures, had their effect, and by 1985-86 the return on shareholders funds had increased to 4.9 per cent.

Australia is now the world's first, second or third largest exporter of about 10 mineral commodities (including alumina, coal, iron ore, lead, nickel, mineral sands—rutile, ilmenite and zircon—and zinc) and a major exporter of many others.

The Australian mineral industry is almost all owned and operated by the private sector. For much of the industry's history the relationship between it and government generally had been simple: State governments granted mining leases, ensured that the mining laws were observed, and collected royalties; the Commonwealth Government collected those taxes to which it was entitled.

Many of the new mines were planned as large scale operations from the very beginning. They needed a large workforce—which had to be housed and provided with community services—and transport facilities to handle millions of tonnes of product each year. Rather than provide these facilities themselves, governments made it a condition of many new mining leases that the companies provided, or made a major financial contribution to, the infrastructure for the mining operation—not only the railways and ports, but the social infrastructure such as streets, houses, schools, hospitals and recreation facilities.

This requirement arose partly because governments had difficulty finding the funds required because of competing demands in a time of rapid economic expansion; but another argument was that, because the mineral deposits belonged to the State, the benefits of their exploitation should go to the public generally as well as the companies concerned. Some governments took this argument further, and made the industry a source of revenue additional to the relatively small amount of royalty payments by imposing charges for services (e.g. rail freights) considerably higher than the cost of providing the service.

## Environmental issues

In the 1950s the industry began to be affected by increasing public concern for the quality of the environment. With the rising awareness that preservation of natural features such as scenery and plant and animal habitats had a value to society, governments increased the controls on discharge of potentially polluting emissions such as water containing sediments or chemicals, and noxious gases. Whereas the industry once, by and large, had priority in land use, it now had to justify its activities in competition with other potential uses of the land. Governments also took account of the likely effect of a proposed mining or treatment process on the surroundings before deciding whether it should go ahead, and required that, where

feasible, mined-out areas be rehabilitated by reshaping and revegetating the surface so that the site could be used for other purposes.

The mineral industry's former priority for land use was eroded further in the 1970s when title to extensive tracts of land in the Northern Territory and some States was granted to the land's traditional Aboriginal owners. One result of this was that companies had to obtain the consent of the Aboriginal owners before they could explore or mine on such land. Because of the significance of land to Aboriginal society, and because of the owners' wish to minimise the effect of a different culture on their traditional way of life, this requirement commonly required prolonged negotiations and this in turn added to the costs and uncertainty of the mineral exploration process.

### **The industry today**

In the late 1970s, the rate of growth of the mineral industry in Australia, which had been maintained for more than 15 years, began to slow. New mines had been developed around the world to meet a forecast demand for minerals which turned out to be overly optimistic. The Australian industry's costs had increased but, in general, mineral prices had not. The industry was largely dependent on exports and had to compete for sales with mines in other countries; some of these mines were less affected by cost increases, or were assisted in various ways by their governments.

Many new coal mines were established in Australia after the second oil shock in 1979, but world demand stagnated, leaving the industry in Australia (and the world) with substantial surplus capacity. Metal prices failed to increase in line with the world economic upturn in the early 1980s, and few new metal mines were opened—Australian production increased largely because of capacity increases at existing mines to achieve economies of scale. Statistics show mine production and exports increased year after year, but the return on funds employed generally was low and a number of mines closed because they had become uneconomic. Petroleum exploration expenditure had increased rapidly after the second oil shock in 1979; several new commercial fields were discovered, especially in south-west Queensland, and, because of the greatly increased price of crude oil, decisions were made to develop some previously uneconomic fields. However, the collapse of world crude oil prices in the first quarter of 1986 completely changed the fortunes of the petroleum industry. Production fell (mainly because of virtual cessation of exports), exploration was reduced sharply, and development of a number of fields was deferred.

At the exploration stage, the industry has to meet new challenges. Not surprisingly, the mineral deposits found in the first century of mineral search were those well exposed at the surface; and the first petroleum accumulations found tended to be the larger, better delineated, ones. Consequently, finding further economic ore bodies and petroleum accumulations has become progressively more difficult, requiring the use of increased skills in applying suitable methods and interpreting the results.

By the mid-1980s, one of the few bright spots in the Australian mineral industry was gold. Because its price was fixed, gold was largely ignored in the expansion of the industry after World War II. Interest revived to some extent when the price was freed in 1968 and strengthened with increasing confidence that the price increases of the late 1970s were likely to be sustained.

Two other factors heightened the interest. One was the development of an efficient method of recovering very fine grained gold; the other was the realisation that modern methods allowed the economic mining by open cut and treatment of an entire zone of gold bearing veins (both the veins and the intervening barren rock) whereas in the past only the veins themselves would have been mined.

So another gold mining boom emerged in the early 1980s. Australian gold production multiplied from 18 t in 1981 to 57 t in 1985. In 1984 and 1985 alone, 24 new gold mines were opened, and retreatment of old tailings began at several centres. Notably, almost all the deposits opened up were close to, or at, old mines—very few were completely new discoveries.

History probably will show that the 1980s was another period of change for the mining industry: a period of consolidation rather than expansion, especially in the structure of the industry, even though the volume of production continued to increase; a period of increasing diversity of export markets, with reduced dependence on a few major customers; a period of strenuous efforts to improve the efficiency of operations; and a period in which the Australian industry, despite far-reaching changes in world mineral production and consumption patterns, was able to retain its role as a major supplier to international markets, and a major source of income for the Australian economy.

## WATER RESOURCES

---

This chapter is divided into two major parts—existing water resources in Australia and the management of these resources. The former provides information on such topics as the geographic background to water resources, surface and groundwater supplies and use, and the drainage divisions in Australia. The latter summarises Australian and State assessment and management of water resources.

For information concerning general, descriptive and historical matter see *Year Book* No. 37, pages 1096–1141 and *Year Book* No. 51, pages 228–31. A special article on drought in Australia, contributed by the National Climate Centre, is included at the end of the chapter.

### Introduction

Rainfall, or the lack of it, is the most important single factor determining land use and rural production in Australia. Chapter 5, *Physical Geography and Climate of Australia* contains details on geographical and climatic features that determine the Australian water pattern. The scarcity of both surface and groundwater resources, together with the low rates of precipitation which restrict agriculture (quite apart from economic factors), has led to extensive programs to regulate supplies by construction of dams, reservoirs, large tanks and other storages.

### Geographic background

#### General

Water resources are determined by rainfall, evaporation and physical features including soil, vegetation and geology. Chapter 5, *Physical Geography and Climate of Australia*, contains a detailed description of the climatic features of the country. A brief description of the landforms appears in *Year Book* No. 61, pages 25–27. In assessing Australia's water resources, dependability and quality of supply must be considered, as well as quantity.

#### Topography

The major topographical feature affecting the rainfall and drainage patterns in Australia is the absence of high mountain barriers. Australia's topographical features range from sloping tablelands and uplands along the east coast Main Divide, through the low plain and marked depression in the interior to the Great Western Plateau.

#### Drainage

Only one-third of the Australian land mass drains directly to the ocean, mainly on the coastal side of the Main Divide and inland with the Murray–Darling system. With the exception of the latter, most rivers draining to the ocean are comparatively short but account for the majority of the country's average annual discharge. Surface drainage is totally absent from some arid areas of low relief.

#### Climate

Australia's large area (7.7 million square kilometres) and latitudinal range (3,700 kilometres) have resulted in climatic conditions ranging from alpine to tropical. Two-thirds of the continent is arid or semi-arid, although good rainfalls (over 800 mm annually) occur in the northern monsoonal belt under the influence of the Australian–Asian monsoon, and along the eastern and southern highland regions under the influence of the great atmospheric depressions of the Southern Ocean. The effectiveness of the rainfall is greatly reduced by marked alternation of wet and dry seasons, unreliability from year to year, high temperatures and high potential evaporation.

## Settlement

The availability of water resources controls, to a large degree, the possibility and density of settlement; this in turn, influences the quality of the water through production and disposal of waste. Most early settlements were established on the basis of reliable surface water supplies and, as a result, Australia's population is concentrated along the coast, mainly in the comparatively fertile, well-watered east, south-east and far south-west.

As settlement spread into the dry inland grazing country, the value of reliable supplies of underground water was realised. Observations of the disappearance of large quantities of the rainfall precipitated on the coastal ranges of eastern Australia eventually led to the discovery of the Great Artesian Basin which has become a major asset to the pastoral industry. Development, however, has not been without costs. Significant environmental degradation and deterioration in water quality are becoming evident.

For further information on the influence of water resources on the spread of settlement in Australia see *Year Book* No. 61, page 860.

In the text and tables below, water volume, usage and flow are shown in litres rather than in cubic metres as in earlier issues. Equivalence and terms used are:

(KL) Kilot litres =  $1.00 \times 10^3$  litres (1 cubic metre)

(ML) Megal litres =  $1.00 \times 10^6$  litres

(GL) Giga litres =  $1.00 \times 10^9$  litres

(TL) Tera litres =  $1.00 \times 10^{12}$  litres

## Surface supplies

### Distribution and volume

As described above, permanent rivers and streams flow in only a small part of the continent. The average annual discharge of Australian rivers has been recently assessed at 398 teral litres (TL) of which 100 TL is now estimated to be exploitable for use on a sustained yield basis. This is small in comparison with river flows on other continents. In addition, there is a pronounced concentration of runoff in the summer months in northern Australia while the southern part of the continent has a distinct, if somewhat less marked, winter maximum.

### Variability of flow

Even in areas of high rainfall, large variability in flow means that, for local regional development, most streams must be regulated by surface storage. However, in many areas evaporation is so great that storage costs are high in terms of yield. Extreme floods also add greatly to the cost of water storage, because of the need for adequate spillway capacity.

### Potential development

Some 83 per cent of all water used in Australia is surface water. This quantity is about 21.5 TL a year and represents about 21 per cent of the possible usable surface water available in Australia; it does not include the amount diverted for hydro-electric power generation and other instream purposes which does not affect the quantity of water available. However, the great variability of river discharge, high evaporation, lack of sites for storage on many catchments, and economic considerations limit potential development. There is, however, considerable scope for greater efficiency in water use.

## Groundwater supplies

About 80 per cent of Australia is significantly dependent on groundwater supplies. Australia's estimated sustainable groundwater yield is 72 TL, and annual groundwater usage is estimated at about 2.2 TL.

Groundwater is divided according to its occurrence in the three main classes of aquifer:

(i) **Shallow unconsolidated sediments** comprise alluvial sediments in river valleys, deltas and basins; aeolian (windblown) sediments which generally occur in coastal areas; and lacustrine (lake) sediments. These sediments are often highly permeable and porous. Perme-

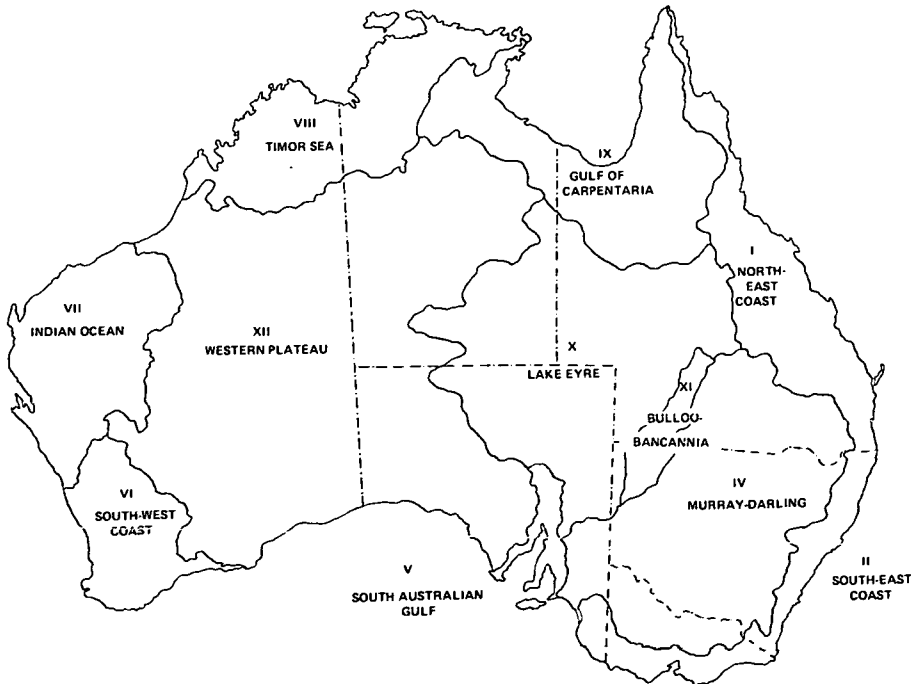

ability and porosity may vary markedly according to orientation. Unconsolidated aquifers of this group generally occur at depths of less than 150 metres and are often readily accessible to sources of water for recharge. Marked seasonal variations in water level are common.

(ii) **Sedimentary rocks** are generally made up of consolidated sediments. The aquifers owe their porosity to small voids between the grains which are often well compacted and cemented. They often cover significant areas, being continuous and of appreciable thickness. Rock strata usually dip quite gently. Nevertheless, over the full extent of the larger sedimentary basins, aquifers may reach great depths. Areas where recharge takes place may be small in relation to the extent of the aquifers. Water quality in individual aquifers may be quite good and fairly uniform over large areas. Some sediments contain a number of permeable and impermeable layers, creating a vertical sequence of separate aquifers, and water quality may vary greatly between them.

(iii) **Fractured rocks** comprise hard igneous and metamorphosed rocks which have been subjected to disturbance and deformation. Aquifers resulting from the weathering of any rock type are also included in this group. Water is transmitted mainly through joints, bedding planes, faults, caverns, solution cavities and other spaces in the rock mass.

The quality of groundwater varies considerably and sources are subject to pollution in much the same way as surface supplies. As a general rule, groundwater from shallow unconsolidated sediments is of good quality but there are instances where groundwater has been polluted, particularly around major urban centres, by sewerage effluent, drainage from refuse tips and from specific industrial pollutants. Supplies from sedimentary basins and fractured rocks are more variable in both quality and quantity, especially in the more arid regions of the continent. High nitrate concentrations tend to be a common occurrence in groundwaters in northern and central Australia.

**Drainage divisions and the use of surface and groundwaters**

AUSTRALIA: DRAINAGE DIVISIONS

To promote a unified approach, river basins or groups of river basins have been adopted as the primary units of assessment. The *Review of Australia's Water Resources 1975* (Department of National Development and Energy, Australian Water Resources Council, Canberra) contains a summary of the 244 river basins grouped into twelve divisions, together with a map showing the divisions. (See above.)

The conjunctive approach to water resources, even to importing water from outside the region, generally makes more water available for use than would be the case with independent use of the various sources. *Year Book* No. 61, pages 867-8 contains details of the conjunctive use of surface and groundwaters.

The second national survey of water use, *1985 Review of Australia's Water Resources and Water Use*, has been conducted by the Australian Water Resources Council. The exploitable yield of surface water for each river basin (aggregating to drainage divisions) was reassessed. The estimates do not take into account the economic potential or value of the diverted water, or the desirability of developing the resource. They represent the volume of water able to be diverted on a regular basis into conventional water supply systems or to substantial private use, utilising existing storages and potential dam sites.

(a) Exploitable yield is estimated total divertible fresh and marginal water taking account of technical factors but not economic, environmental or social constraints. (b) Urban, industrial and agricultural uses of water only. In-stream uses such as hydro-electric generation are not included.

NOTE: n.s. = not significant.

## Water quality

The quality of surface water in Australia varies greatly and is controlled by climate, geology, stream flow rates, biological activity and land use. Most of the variability is related to water events such as storm flows, floods and drought. Water pollution is generally at a low level compared to other similarly developed countries. The great majority of Australians enjoy domestic, irrigation and recreational waters of good to excellent quality.

Very little is known of the water quality conditions which prevailed prior to European settlement and development in Australia. It is therefore difficult to judge the full impact of urban, agricultural, industrial and mining developments, and the effects that water resource development measures, such as large dams, have had on the quality of the resource. Levels of toxic pollutants have undoubtedly increased, as have the salt and sediment loads of the rivers. While water quality would, at times, have been poor prior to settlement, levels are believed to have generally declined. On the other hand, regulation of major rivers has reduced some of the impacts of floods and droughts.

An increasing appreciation of water quality in recent times has led to improved management. Measurable improvements in water quality over the last decade have resulted from

pollution controls in industry and mining, and more effective sewerage treatment. Means of control of pollution from widespread agricultural activity such as problems of salinity and turbidity, are under development.

The major water quality issues and problems faced in Australia are salinity, turbidity, excessive plant and algal growths (eutrophication), and water treatment for small community water supplies. There is also a scarcity of data, information and research on some aspects of water quality and the protection of aquatic species and habitats. Many of the severe pollution problems found in other countries have been avoided in Australia, because of the general absence of highly polluting industries and the location of major cities on or near the coastline enabling ocean disposal of wastes.

Groundwater is an important substitute for surface water in many parts of the country such as in the arid interior where the Great Artesian Basin provides the only reliable continuous supply of water for stock and domestic purposes. This Basin underlies 23 per cent of the continent but the high ratio of sodium to calcium and magnesium ions has an adverse effect on soil structure, rendering it impervious and generally unsuitable for irrigation.

Groundwater is increasing in importance as a source of water for irrigation, industry and domestic supply. Following measurements taken in 1983-84, divertible resources and abstraction of groundwaters in the twelve drainage divisions are shown below.

#### GROUNDWATER ESTIMATES OF DIVERTIBLE RESOURCES AND ABSTRACTION BY DRAINAGE DIVISIONS, 1983-84

(a) The divertible groundwater resource is the volume of water that can be withdrawn from an aquifer on a sustained basis without depleting the storage; however in practical operation of many groundwater storages 'sustained basis' may mean about 30 years or so, rather than indefinitely.

NOTE: n.s. = not significant

Increasing use is made of conjunctive schemes, for example, where groundwater supplies are tapped to augment surface water or where, as in the Burdekin Delta, groundwater aquifers are artificially recharged during the summer wet season to enable water to be stored at low cost with negligible evaporation.

Total water use or gross water consumed is the water supplied that is not returned to a stream or body of fresh water or diverted for use a second time. The total water use from 1 July 1983 to 30 June 1984 has been estimated to be 14,629 GL corresponding to an overall per capita use of 2,600 litres per day. Of this total, approximately 70 per cent was for irrigation, 21 per cent was for urban/industrial uses and 9 per cent was for other rural water use. Withdrawals for hydro-electric power have not been included. In terms of sources for the water used, by far the largest proportion (over 80 per cent) of water is drawn from surface water. Groundwater sources, although of importance in some regions, account for only a minor percentage of the water used.

### Major dams and reservoirs

A *Register of Large Dams in Australia* was published by the Australian National Committee on Large Dams in December 1982. The publication included, in chronological order, all large dams completed or under construction up to December 1982. In the list below, only dams with a gross reservoir capacity of more than 100 GL have been included. The list is based on the above publication and supplementary data for the latest years.

#### MAJOR DAMS AND RESERVOIRS IN AUSTRALIA

| Name and year of completion | Location                          | Gross capacity      | Height of wall  | Purpose           |

For footnotes and abbreviations *see* previous table.

## Water management

Australia's water resources are managed by a multitude of irrigation authorities, metropolitan water boards, local government councils and private individuals. State authorities dominate the assessment and control of water resources as, under the Commonwealth Constitution, primary responsibility for management of water rests with the individual State governments. The Commonwealth Government is responsible for matters relating to its Territories, and participates indirectly through financial assistance or directly in the co-ordination or operation of interstate projects through bodies such as the River Murray Commission. In other instances where political boundaries intersect some river basins, co-operation between governments has been necessary to develop resources.

Australia's attitudes to water resources management have changed substantially over the last twenty years. Water management is no longer seen just in terms of storing water and regulating streams for consumption, but also in terms of conserving unregulated streams in an unmodified landscape for wild life preservation or recreation purposes or for possible social or economic use by future generations. In addition, agricultural, industrial and urban development has led to greater attention being paid to water quality management.

The development of water resources in the States has an important bearing on the Commonwealth's broad interests in economic management, resource allocation, foreign exchange earnings, distribution of income and related matters. Consequently, the Commonwealth has participated in water resource matters in the States in instances of mutual Commonwealth/States concern or in the national interest.

## Commonwealth water policy

In September 1984, the Commonwealth released its new water policy. The objectives are to:

- ensure availability of water, adequate in quantity for all beneficial uses;
- adopt measures which improve the efficiency of water supply and use;
- develop a comprehensive approach to inter-related water and land management issues;
- encourage comprehensive long-term plans for the development and management of water resources;
- implement financial and economic policies which distribute the costs of water supplies equitably and provide incentives for the more economic use of resources at government and individual level.

As part of the new water policy, funds are available to the States and the Northern Territory under a program, the Federal Water Resources Assistance Program (FWRAP), which commenced in 1984–85. Funds are available for purposes which include:

- water resource development or management activities/projects for agriculture, urban or industrial purposes;
- floodplain management;
- collaborative information programs;
- salinity reduction and land drainage;
- State-wide and broad regional water plans;
- public education.

The Country Towns Water Supply Improvement Program, which commenced under the Community Employment Program, has been continued as a sub-program of FWRAP.

## Research and continuing assessment of water resources

### Australian Water Resources Council—AWRC

The AWRC was established in 1963 by joint action of the Commonwealth and State Governments. The Council consists of the Commonwealth, Northern Territory and State Ministers who have primary responsibility for water resources; it is chaired by the Commonwealth Minister for Primary Industries and Energy.

The Council provides a forum for the water industry. With the shift in emphasis that has occurred in the water industry in recent years from water resource development to resource management and the growing importance of urban water issues generally, the AWRC is extending its scope to focus on industry-wide issues such as pricing and financial policies, resource management, technology and organisational management and strategy. The Council's terms of reference also include the promotion of programs to assess Australia's water resources, the encouragement of education and training in hydrology, the co-ordination and dissemination of information, the promotion of water research, and development of liaison with overseas and international organisations in the field of water resources.

The Council is supported by a Standing Committee, comprising permanent heads of relevant State authorities and the Commonwealth Department of Primary Industries and Energy. CSIRO and the Bureau of Meteorology are also represented and Ministers can nominate additional representatives in accordance with the requirements of the agenda for each meeting.

Following a review held in late 1984, the Standing Committee is now serviced by four advisory committees which consider issues in water industry planning, surface water and catchments, groundwater and water technology. The Council can also establish ad hoc task groups, for advice on particular topics, and is currently being assisted by an Expert Panel on Education and Training, and a National Co-ordinating Committee on Aquatic Weeds.

### Water resources assessment

In 1964, in response to a perceived lack of water resources data throughout much of Australia, the Commonwealth Government instituted, through the AWRC, the National Water Resources Assessment Program. The original aim was to expand the stream gauging network in Australia and increase the level of information on groundwater. In 1974, the collection of water quality data was added to the program. The program has been successful in filling many of the data gaps which existed prior to 1964, in providing data and information

for water resources planning, construction projects and in the development of the understanding of the nature and function of Australia's water resources. Commonwealth involvement in this program has now ceased. However data collection programs, involving co-operation between Commonwealth and State authorities are continuing in the Murray Basin.

### **Water resources research**

The Department of Primary Industries and Energy is responsible for Commonwealth interests in water resource matters, including research policy and co-ordination.

A water research program was funded and administered on behalf of the Australian Water Resources Council from 1968 until 1984. In June 1985, the Australian Water Research Advisory Council (AWRAC) was established to advise on national water research needs and on a Commonwealth funded program of water research. Funds totalling \$3.4 million were allocated in 1986-87 to research programs recommended by AWRAC. Projects included work on salinity, groundwater, stream ecology, water management, water treatment and quality, hydrology and soil/plant water relations; fellowships; and activities to effectively disseminate the results of research. The Murray-Darling Freshwater Research Centre at Albury and the Urban Water Research Association also received financial support.

Water research is undertaken at the Commonwealth level by CSIRO; the Bureau of Meteorology; the Australian Nuclear, Science and Technology Organisation (ANSTO); the Bureau of Mineral Resources, Geology and Geophysics (BMR); and the Alligator Rivers Regional Research Institute (ARRRI). The water research programs of these major national agencies are co-ordinated through a Water Research Liaison Committee which advises the Ministers of Primary Industries and Energy and of Science and Technology on water research in Commonwealth Government agencies.

At the State level, water agencies have extensive laboratory facilities for water quality testing. However, most water related research is undertaken in research centres associated with agriculture, fisheries, forestry and environmental authorities. At the regional level, some of the larger authorities providing water supply and sewerage services undertake applied research on a very limited scale.

A significant proportion of Australian water research is undertaken by researchers in tertiary education institutions with the aid of either internal funding or grants from outside bodies, such as AWRAC or the Australian Research Grants Committee. Water research is carried out within a range of disciplines, including the biological and social sciences and engineering.

## **International aspects**

### **International water organisations**

Australia liaises with international bodies and United Nations agencies concerned with water resources and participates in their activities in various ways.

#### **Economic and Social Commission for Asia and the Pacific—ESCAP**

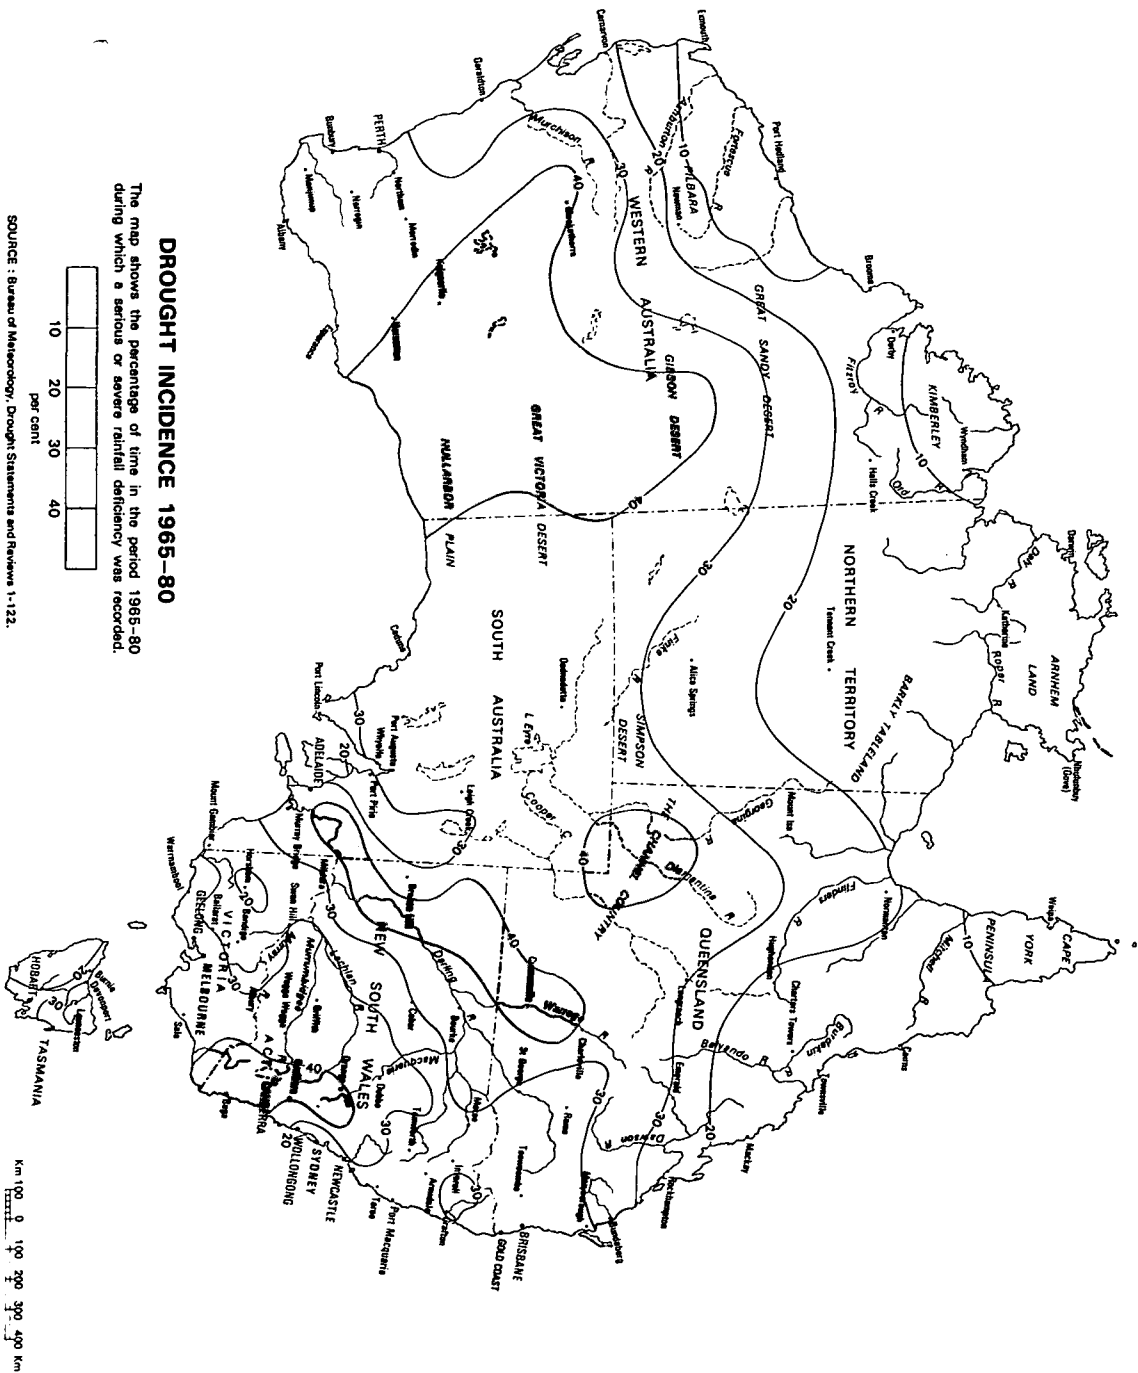

This United Nations Commission, through its Committee on Natural Resources, reports on water policy issues in addition to other activities. By participating in this forum and in seminars arranged on selected topics, Australia contributes to, and benefits from, identification of and discussions on the main problems of water resources management in a densely populated, developing region. Australia is also an active participant in ESCAP's water information exchange system and a contributor to ESCAP's Water Resources Journal and its newsletter, *Confluence*.

#### **Organisation for Economic Co-operation and Development—OECD**

Australia's membership of the OECD since 1970 has involved participation in the work of the Environment Committee, particularly the Natural Resource Management Group, the Water Management Group and its Group of Economic Experts, which investigates problems which are the subject of international concern and the development of strategies to resolve them.

#### **United Nations Educational, Scientific and Cultural Organization—UNESCO**

Australia has contributed to the international program designed to advance the science and practice of hydrology and the International Hydrology Program (IHP), through an Australian UNESCO Committee for the IHP. Australia is a member of the Inter-governmental Council for IHP.

**DROUGHT INCIDENCE 1965-80**

**SURFACE WATER QUANTITY AND QUALITY**

Kilometres 100 0 100 200 300 400 Kilometres

### **World Meteorological Organization—WMO**

Through its Commission for Hydrology, WMO is the specialised UN agency dealing with operational hydrology—the measurement of basic hydrological elements, water resources assessment and hydrological forecasting. WMO has an Operational Hydrology Program (OHP) which is co-ordinated with and complemented by UNESCO's IHP. Within the OHP is the Hydrological Operational Multipurpose Subprogram (HOMS) involving the organised transfer of hydrological technology among members. Australia is a contributor to HOMS and has established a HOMS National Reference Centre within the Secretariat of AWRC. In Australia, hydrological and meteorological activities relative to water resources are co-ordinated by the Secretary of the AWRC as hydrological advisor to the Permanent Representative of WMO in Australia, the Director of Meteorology.

### **United Nations Environment Program—UNEP**

Australia participates in a world registry of major rivers covering discharge and pollutants and of clean rivers so defined and in the development of methodology for analysis and planning of water resources management.

### **World Health Organisation—WHO**

Australia is participating in the water quality monitoring component of the WHO Global Environmental Monitoring System (GEMS) which provides a consistent global overview of changes in water quality.

## **National and interstate agreements**

In the section on water management above, reference was made to the responsibilities of government on the national, State and local authority levels. In this section, some additional details are provided on their roles in the management of water resources.

The flows of many of the tributaries to the River Murray which make up the Murray-Darling Basin have been regulated for irrigation and water supply purposes. Approximately 27 GL of storage has been constructed in the Murray-Darling basin. Of this, about 12 GL of storage has been constructed along the River Murray, including the barrages, locks and weirs. With an average annual diversion from the Murray of approximately 4 GL, the degree of resource utilisation is only approximately 40 per cent.

### **River Murray Waters Agreement**

The *River Murray Waters Act 1915* ratified an Agreement between the Commonwealth and the States of New South Wales, Victoria and South Australia. *Year Books* prior to No. 39 contain a number of summaries of the historical events leading to the Agreement of 1914 which provided for a minimum quantity of water to pass to South Australia. Further details on the River Murray Waters Agreement and subsequent amendments may be found in *Year Book* No. 61, pages 870–2.

The River Murray Commission, established in 1917 to give effect to the Agreement, is responsible for the management of the flow of water in the River Murray, the construction, maintenance and operation of storages and other regulatory works to make water available for irrigation, navigation, stock and urban purposes; and for the allocation of water between the States of New South Wales, Victoria and South Australia. It also has responsibility for management of the catchment above Hume Dam and for the management of the flow of water in the Darling River below Menindee Lakes.

Dartmouth and Hume Reservoirs, together with Lake Victoria and the Menindee Lakes storages, are the key storages operated by the River Murray Commission to regulate the River Murray system. A series of weirs along the river provide for irrigation diversions and pumping facilities by the three States. The major diversion weir is at Yarrawonga. All of the weirs except Yarrawonga have locks to enable navigation of the river to be maintained.

A new River Murray Waters Agreement, which was approved by legislation and proclaimed by the four Governments on 1 February 1984, broadened the role of the River Murray Commission to allow for more direct and independent action in the management of the Murray. The 1984 Agreement enables the Commission to consider water quality, recrea-

tion, flood mitigation and environmental issues in relation to the management of the river system, in addition to its traditional role.

In relation to water quality, the Commission is authorised to:

- initiate proposals for the protection or improvement of River Murray water quality;
- co-ordinate or carry out investigations and studies into the feasibility of works or measures for the improved conservation and regulation of the waters of the River Murray, to protect or improve its quality;
- measure and monitor water quality of the waters of the Murray and its tributaries;
- formulate water quality objectives and recommend water quality standards for adoption by the contracting governments;
- make recommendations to contracting governments or any authority, agency or tribunal on any matter which may affect the quality or quantity of the River Murray waters.

A particular feature of the 1984 Agreement is that the State contracting governments are required to advise the Commission of any proposal within their States which could significantly affect the quality and quantity of the River Murray waters.

The Agreement enables the Commission to clearly define the principles of water sharing laid down in the original Agreement; to enable a water accounting system to be introduced and to carry out river protection works and remedial works (including salinity mitigation works) where the need arises. The Commission can also recommend future amendments to the Agreement.

As part of the initiative launched in 1985 by the Commonwealth and the States of New South Wales, Victoria and South Australia to achieve improved management of the natural resources of the Murray-Darling Basin consideration is being given to the establishment of a Murray-Darling Basin Commission to replace the River Murray Commission. The new Commission would encompass the regulatory responsibilities currently provided for under the River Murray Waters Agreement as well as responsibilities for land, environmental and water matters not covered in the Agreement.

### **New South Wales—Queensland Border Rivers Agreement**

As a result of an Agreement between the Premiers of Queensland and New South Wales, Acts were passed by the Parliaments of both States in 1946 and 1947 respectively, establishing the Dumaresq—Barwon, Border Rivers Commission. The Commission is responsible for the conservation and equal sharing of the waters of the Dumaresq River upstream of Mingoola, the regulation of the border rivers downstream of Mingoola and the equitable distribution of the waters of the streams which intersect the Queensland—New South Wales border west of Mungindi.

The duties of the Commission include measurement of stream flows; investigation of proposals for better conservation, regulation and distribution of water resources; and construction and maintenance of dams, weirs, regulators or other works for the storage, regulation and distribution of flows.

The Commission has constructed Glenlyon Dam on Pike Creek in Queensland which has a storage capacity of 261 GL, and a number of regulators and other water distributory works on the river systems under its control.

### **Snowy Mountains Hydro-electric Scheme**

The Snowy Mountains Scheme is a dual purpose hydro-electric and irrigation complex located in south-eastern Australia and on its completion was one of the largest engineering works of its type in the world. It impounds the south-flowing waters of the Snowy River and its tributary, the Eucumbene, at high elevations and diverts them inland to the Murray and Murrumbidgee rivers through two tunnel systems driven through the Snowy Mountains. The Scheme also involves the regulation and utilisation of the headwaters of the Murrumbidgee, Tumut, Tooma and Geehi rivers.

The Scheme was designed and constructed by the Snowy Mountains Hydro-electric Authority, a statutory body established by the Commonwealth Government in 1949, and was substantially completed by 1974. Its installed generating capacity is 3,740 MW and its average annual electricity output is over 5,000 GWh. An average of 2,300 GL of water per year has become available for irrigation in the Murray and Murrumbidgee rivers as a result of the Scheme.

Details of the Scheme are given in a special article, included in *Year Book* No. 70, pages 430-6.

The Snowy Mountains Council, constituted of representatives of the Governments of the Commonwealth, New South Wales and Victoria and the Snowy Mountains Hydro-electric Authority, was established on 2 January 1959. Its main functions are to direct and control the operation and maintenance of the permanent works of the Snowy Mountains Scheme, in particular the control of water and the allocation of loads to generating stations.

## States and Territories

The foregoing text deals with water conservation and irrigation in Australia generally and with international, national and interstate aspects. The following material covers the local pattern of water resources and the steps taken by the State governments to bring about their development. In the various States, water policies tend to assume a distinctive and characteristic pattern closely allied with climatic conditions and specific local needs.

In Victoria, almost every form of water scheme is in operation. In New South Wales, the management of irrigation water supplies is an area of major emphasis, with approximately two-thirds of a million hectares under irrigation. In Queensland, up to the present, the predominant emphasis has fallen on water (mainly underground sources) for stock and the development of small irrigation schemes in sub-humid and humid areas, principally to stabilise production of such crops as tobacco, sugar, cotton and pastures. Apart from regular irrigation practices along the Murray River, South Australian authorities are vitally concerned with reticulated supplies for rural areas and towns. Western Australia has developed unique rock catchments and piped supplies for agricultural areas and towns in dry districts. Tasmanian interest relates almost exclusively to hydro-electric generation. The Northern Territory is concerned primarily with water supplies for population centres and mining and pastoral industries.

## New South Wales

### Administration

The New South Wales Department of Water Resources was set up in 1987, superseding the previous Water Resources Commission. Its main responsibilities are to co-ordinate policies and programs of all State and local government authorities providing water supplies and other water services; to plan for future water needs; and to operate the rural water supply network, control the use of both surface water and groundwater resources through a licensing system, provide floodplain management and flood mitigation services in non-tidal areas, maintain water resources assessment programmes, and maintain stable river channels.

### Water use

In New South Wales, about 14 per cent of all consumptive use of water is by Newcastle-Sydney-Wollongong. By far the largest category of total use in the State is irrigation (74 per cent), while farm uses other than irrigation make up a large part of the remaining 12 per cent.

### Urban water

Water supply for Sydney-Wollongong is drawn from seven main storage dams and several smaller storages in the catchments of the Hawkesbury, Georges and Shoalhaven Rivers. Newcastle's water is taken from two storage dams and from groundwater in extensive coastal sand beds. Country towns are serviced variously by dams built specifically for their purposes, by run-of-river pumping, by pumping from rivers in which flows are regulated by irrigation dams, and by groundwater extractions.

### Irrigation

The bulk of irrigation development is from rivers of the Murray-Darling Basin, on the inland side of the Great Dividing Range, where both landforms and climate are conducive to large-scale irrigation. Regulated water supplies are provided from twenty-four main storages, including four shared with Victoria and South Australia, and one shared with Queensland.

There are two principal irrigation arrangements. One is licensed irrigation, practised State-wide, in which licensees take water from rivers, usually by pumping, with works constructed by themselves at their own cost. Licensed irrigators use on average 1.5 million ML of water annually. The other is irrigation in nine Irrigation Areas and ten Irrigation Districts, all located along the three most southern inland rivers—the Murray, Murrumbidgee and Lachlan.

The Irrigation Areas and Districts contain over 6,000 individual farms and holdings covering nearly 1.4 million hectares. About half a million hectares is usually irrigated, using 2.8 TL of water. An increasingly used source of water for irrigation is the groundwater in alluvial deposits, mostly in the inland. Extractions from licensed high-yielding bores now approach 300 GL a year.

The annual gross value of production from irrigation is of the order of \$750 million—about 20 per cent of the State's total agricultural production—although little more than 1 per cent of all agricultural land is irrigated.

### **Future program**

With large dams on all main inland rivers, there is little prospect of further major irrigation storage construction in the foreseeable future after completion of Split Rock Dam. Attention is to be focussed on improved management and efficiency in water supply and water use, checking and correcting developing problem areas through both management and physical works, and taking stock of the water needs of the natural environment.

Possibilities for greater water efficiency include additional small re-regulating storages along controlled rivers, improved delivery systems, loss reduction and reduction of waste in end-use both in urban areas and on-farm. Increased flexibility is being provided for irrigators through water entitlement transfers and other management measures to enable economic optimisation of production.

Waterlogging and salinisation of farming lands will continue to be addressed by both physical works and management measures. Aging infrastructure works are also to receive attention with modernisation and replacement, while the program of floodplain management and flood mitigation will be continued. Water management procedures in aquatic environments (with first emphasis on wetlands) could be amended following studies currently under way.

## **Victoria**

### **Administration**

Water resources in Victoria are administered by three major agencies, the Department of Water Resources, the Melbourne Metropolitan Board of Works and the Rural Water Commission. The Department of Water Resources is the central policy and planning agency providing advice to the Minister of Water Resources on matters of State-wide interest. The Melbourne Metropolitan Board of Works is a statutory corporation responsible for providing water, sewerage, main drainage and managing waterways and metropolitan parks for the people of Metropolitan Melbourne. The Rural Water Commission is also a statutory corporation and its primary mission is to manage relevant water and land resources, to provide water, water related services and the necessary infrastructure for irrigation, domestic and stock, commercial, industrial, recreational and environmental uses in non-metropolitan areas of Victoria.

### **Rural water supply systems**

The principal irrigation systems in Victoria are:

- **Goulburn-Campaspe-Loddon.** The main storage is Lake Eildon with a capacity of 3,390 gegalitres. The main products in these systems are dairy products, fruit, wool and fat lambs. Annual production of deciduous canning fruits in the eastern part of the system is about two thirds of Australia's total.
- **Murray River System.** The Murray Valley Irrigation Area and the Torrumbarry Irrigation System are irrigated by water diverted at the Yarrawonga and Torrumbarry Weirs respectively. These areas are devoted mainly to dairying, fat lambs and canning fruit (Murray Valley) and dairying, fat lambs, vineyards, orchards and market gardens

(Swan Hill). Downstream from Swan Hill, the First Mildura Irrigation Trust and four Commission Districts are supplied by pumping, and produce mainly dried vine fruits, citrus fruits, and table and wine grapes.

- **Southern Systems.** The Maffra-Sale-Central Gippsland district, supplied from the Macalister River and regulated by Lake Glenmaggie, is devoted mainly to dairying.
- **Werribee and Bacchus Marsh.** These districts produce fresh fruit, vegetables and dairy products mainly for the local domestic market. Irrigation is supplied from the Werribee River system which is regulated by three main storages: Pykes Creek, Melton Reservoir and Lake Merrimu.
- **Wimmera-Mallee Domestic and Stock Supply System.** Storages in the Grampian Ranges ensure farm water supplies over the riverless pastoral and cereal lands to the Murray. Without this supply, occupation of the region would be extremely hazardous. There are small areas of irrigation supplied from this system near Horsham and Murtoa.

### **Future programs**

Proposed capital works expenditure by the Rural Water Commission continues to place increasing importance on infrastructure replacement and rehabilitation, urban water services, waterways and floodplain management, environmental protection and water quality improvement.

Major provisions in the program include:

- rehabilitation of headworks—Glenmaggie, Coliban, Melton and Cairn Curran;
- provision of urban water services, excluding water boards and sewerage authorities;
- replacement, rehabilitation and extensions of rural water supplies, including drainage, private diversions and salinity control works;
- management of waterways and related lands, floodplain management and control of flood protection districts.

## **Queensland**

### **Administration**

The control of surface and underground water is exercised by the Commissioner of Water Resources on behalf of the Crown through the licensing of all artesian bores, sub-artesian bores within districts declared for the purpose, and works for the conservation and use of surface water together with the issuing of permits for domestic and stock water use.

In respect of the water resources of the State, the Commissioner is required to prepare a complete description and keep a record of naturally occurring surface and underground water; evaluate the present and future requirements for, and plan the development of, those water resources; take steps to protect the resources from factors likely to be detrimental to their quality or diminish their quantity; investigate and survey any natural water resource; co-ordinate the investigation, evaluation and development of plans for the control of floodwaters and mitigation of flood damage; and construct and manage works for the conservation, replenishment, utilisation and distribution of water.

The Commissioner is principally responsible for water conservation and supply for rural purposes including irrigation, domestic and stock supplies but where possible dual or multi-purpose use is made of works for irrigation, rural, urban and industrial purposes including power generation and mining.

### **Summary of schemes**

Approximately half of the area irrigated in Queensland now uses water from storages constructed by the Queensland Water Resources Commission. The balance is irrigated from unsupplemented surface or underground supplies spread widely throughout the State. Because of the predominance of irrigation by private diversion from streams, as opposed to channel systems delivering water to farms, most of the storages release water to maintain supplies downstream.

## Irrigation areas

Approximately one-third of the area irrigated in Queensland each year is concentrated in eight Irrigation Areas constituted under the Irrigation Act where the supply is generally reticulated by channel systems to the farms.

| <i>Irrigation areas</i>    | <i>Location and source of supply</i>                                                                                |
|----------------------------|---------------------------------------------------------------------------------------------------------------------|
| Dawson Valley . . . . .    | Centred on Theodore. Four weirs on Dawson River.                                                                    |
| Burdekin River . . . . .   | South of Townsville. Dams and weirs on the Burdekin River and its tributaries and including the Burdekin Falls Dam. |
| Mareeba-Dimbulah . . . . . | Hinterland of Cairns. Tinaroo Falls Dam.                                                                            |
| St George . . . . .        | Centred on St George. Beardmore Dam.                                                                                |
| Emerald . . . . .          | Centred on Emerald. Fairbairn Dam.                                                                                  |
| Bundaberg . . . . .        | Centred on Bundaberg. Fred Haigh Dam and barrages on the Kolan and Burnett Rivers together with upstream weirs.     |
| Eton . . . . .             | Hinterland of Mackay. Kinchant Dam supplemented by diversion of water from Pioneer River.                           |
| Lower Mary River . . . . . | Upstream from Maryborough. Borumba Dam and barrages on the Mary River and Tinana Creek.                             |

## Irrigation projects

These are schemes established under the *Water Act 1926-1983*, where water is released from storages to maintain supplies for pumping under licence to land adjacent to the streams. Details of the projects are set out in the accompanying table.

### IRRIGATION PROJECTS, QUEENSLAND, 1985-86

| <i>Project</i>                  | <i>Authorised allocations</i> |                   |                       |                   | <i>Actual use</i> |                   |                                 |

(a) Comprises industrial, urban, waterharvesting, rural water supply, stockwater and other uses. (b) Includes water allocations and use in Lower Mary River Irrigation Area.

## Rural water supply schemes

Rural water supply schemes based on surface and underground water are constituted under the Water Act to improve water supplies for irrigation, mining, urban, domestic and stock use. These schemes are managed by Boards representing the ratepayers within the areas.

## Underground water supplies

The availability of underground water, particularly the Great Artesian Basin, has played a major part in the development of the pastoral industry in Queensland. Underground water is also used extensively for irrigation on individual farms, particularly along the coastal fringe, and for domestic purposes. Some 45 per cent of the area irrigated in Queensland receives its supplies from underground sources. In accordance with the requirements of the *Water Resources Administration Act 1978-1984* the investigation of the availability of underground water is being pursued by geological mapping, investigation drilling and hydro-geological assessment. The predominant areas where water from this source is used for irrigation are the Burdekin Delta, Condamine Valley, Bundaberg, Lockyer Valley, Callide Valley and Pioneer Valley.

## Western Australia

### Administration

The Minister for Water Resources administers the State operated irrigation schemes under the *Rights in Water and Irrigation Act, 1914-1978*. The Minister is advised by an Irrigation Commission representing the local irrigationists and government, technical and financial branches. Under the *Country Areas Water Supply Act, 1947-1979*, the Minister also administers the water supplies to most country towns and reticulated farmland, as well as controls minor non-revenue producing supplies to stock routes and a few mines and agricultural areas with their associated communities. A small number of town supplies are administered by local boards under the *Water Boards Act, 1904-1979*, which provides a large degree of autonomy with ultimate Ministerial control.

### Irrigation

Irrigation schemes have been established by the government on the coastal plain south of Perth, the water being channelled from dams in the adjacent Darling Range. The success of dairying and stock raising and, to a lesser extent, vegetable growing, which have replaced citrus growing, has led to a gradual but substantial extension of irrigation areas in the south-west.

Irrigation areas at Carnarvon and on the Ord and Fitzroy Rivers in the Timor Sea Drainage Division are established in the north of the State.

Since the mid-1930s, a centre of tropical agriculture has been developed at Carnarvon, near the mouth of the Gascoyne River. Initially, the principal source of irrigation water for plantations was private pumping from the sands of the Gascoyne River. Overpumping by the growers however, resulted in salt intrusion into the fresh water aquifer. Government controls were introduced and a major groundwater supply scheme upstream of the irrigation area has since been commissioned. A tropical research station is maintained at Carnarvon by the Department of Agriculture.

The Ord River Irrigation Project in the Kimberley Division provides for the eventual development of an irrigation area of some 70,000 hectares of land, one-third of which is in the Northern Territory.

The Camballin Irrigation District on the Fitzroy River floodplain in the West Kimberleys is dependent on diverted river flows and a small volume of storage behind the diversion structures on the Fitzroy River and Uralla Creek.

### Country water supplies controlled by the Water Authority of Western Australia

Since 1947, enlargement and extensions of the Goldfields and Agricultural Water Supply and the development of the Great Southern Towns Water Supply have been carried out, mainly in accordance with a project known as the Modified Comprehensive Scheme. Under this scheme water has been supplied to towns and farms in the cereal and sheep districts of the State. Two years after the completion of the 1.7 million hectare scheme in 1961, an extension of 1.5 million hectares was agreed to with Federal-State funding.

#### Goldfields and Agricultural Water Supply

Water for the Eastern Goldfields is supplied by pipeline from Mundaring Reservoir in the Darling Range.

#### West Pilbara Water Supply

The West Pilbara Water Supply serves consumers in the towns of Dampier, Karratha, Roebourne, Wickham and Point Samson and industrial complexes at Dampier, Cape Lambert and the Burrup Peninsula. Water was previously supplied exclusively from the Millstream groundwater source but the Harding Dam (opened in 1985) will provide 80 per cent of total supply with Millstream providing drought security.

#### Geraldton Regional Water Supply

The Geraldton Regional Water Supply is supplied principally from the Allanooka groundwater source and a small amount from Wicherina (groundwater plus catchment).

#### Great Southern Towns Water Supply

This scheme provides water to towns and localities from Wellington Dam to Narrogin and along the Great Southern Railway from Brookton to Tambellup.

**Port Hedland Water Supply**

The Port Hedland Water Supply supplies Port Hedland, South Hedland and Wedgefield from the Yule River and De Grey groundwater sources.

**The Mandurah Regional Water Supply**

This scheme obtains supplies from the South Dandalup Dam and the Ravenswood groundwater source.

**Local and other Regional Water Supplies**

As well as the major water supply schemes above, water is also supplied by the government from seven other Regional Water Supply Schemes to 21 towns and from 104 local water supply schemes to 271 towns. The water comes from a variety of sources including underground, artificial catchments and stream flows.

**Aboriginal Communities Water Supplies**

Work has commenced on a program to upgrade the water services of remote Aboriginal communities. The program involves providing a town level of service to 40 communities and a support maintenance service to 29 of the 40 communities. Water for these supplies will come predominantly from underground sources.

**Underground water**

Considerable use is made of groundwater by individual farmers, pastoralists, market gardeners and others, although the water quality varies from place to place and much of it is too saline for irrigation or even stock purposes. Artesian wells throughout the State and non-artesian wells within 'declared' areas must be licensed under the *Rights in Water and Irrigation Act, 1914-1978*. Industries also use groundwater in substantial quantities, especially in the processing of titanium, iron and alumina, and this demand has intensified the search for groundwater.

**South Australia****Administration**

All major water resources and most public water supply schemes in South Australia are administered by the Engineering and Water Supply Department under the various statutes mentioned below.

- The *Waterworks Act, 1932-1984*, which empowers the Minister of Water Resources to impound or divert the water from any lake, watercourse or underground source for the purpose of establishing and maintaining public water supply schemes to serve proclaimed water districts throughout the State.
- The *Water Conservation Act, 1935-1975*, provides for the control of small reservoirs, bores, tanks, etc. established in remote areas as emergency water supplies or to assist local development.
- The *River Murray Waters Act, 1983*, which ratifies the River Murray Waters Agreement, and under which the Engineering and Water Supply Department operates and maintains Lake Victoria storage, nine weirs and locks downstream of Wentworth, New South Wales, and barrages at the river mouth.
- The *Water Resources Act, 1976-1983*, provides for the management of all aspects of water—surface and underground, quality and quantity. The Act provides for the control of diversions of surface waters from Proclaimed Watercourses and for the withdrawal of underground waters from Proclaimed Regions. It establishes a South Australian Water Resources Council and Regional Advisory Committees as vehicles for public participation in the water resources management process, and a Water Resources Appeal Tribunal to give individuals the opportunity to appeal against decisions of the Minister pursuant to the Act.

**Summary of schemes**

South Australian irrigation commenced with an agreement involving the Chaffey brothers in 1887 whereby an area was made available for the establishment of certain irrigation works at Renmark. From this start, government, co-operative and private irrigation areas totalling more than 42,000 hectares have been developed in the South Australian section of the Murray Valley. The authority controlling River Murray irrigation is the Engineering and Water Supply Department.

Except for quantities held in various lock pools and natural lakes, no water from the Murray is stored within South Australia for irrigation purposes. In addition to irrigation from the River Murray there are considerable areas irrigated from underground sources.

### **Adelaide Metropolitan Water Supply**

In 1986-87, River Murray pipelines supplied 20 per cent of the total intake to the Metropolitan Adelaide Water Supply System, compared to 53 per cent for the previous year. The principal sources of supply for the nine storages in the Mount Lofty Ranges are the Rivers Onkaparinga, Torrens, South Para, Myponga and Little Para.

### **Country reticulation supplies**

A number of reservoirs in the Barossa Ranges and other local sources are augmented by the Morgan-Whyalla, Swan Reach-Stockwell and Tailem Bend-Keith pipelines which provide River Murray water to extensive country areas. Surface and underground resources have been developed to supply most country centres not covered by the larger schemes.

### **Murray River irrigation areas**

Where irrigation water in excess of plant requirements has been applied, perched water tables develop. Rising to the level of tree roots, these cause the death of orchards from salination and water-logging. Most orchards and vineyards are now drained by plastic and tile drainage systems, thus restoring their health and productivity. Disposal of drainage water is achieved by pumping to basins on river flats where it is evaporated, or by discharge into the river when it is in flood—apart from those areas connected to the Noora Drainage Disposal Scheme, completed in 1984. In the same year, another salinity project, the Rufus River Groundwater Interception Scheme, was commissioned. This scheme involves the intercepting of saline seepage to Rufus River (which flows from Lake Victoria to the Murray) and pumping it to an evaporation basin east of Lake Victoria and outside the river valley.

## **Tasmania**

### **Main purposes of water conservation and utilisation**

Because of the generally more adequate rainfall in Tasmania, scarcity of water is not such a problem as it is in most mainland areas. The only large-scale conservation by reservoirs is for hydro-electric power generation, but there are some moderately-sized dams built for mining and industrial interests, for irrigation and by municipal authorities for town water supplies.

Until a few years ago irrigated areas were negligible except for long established hop fields, but there is a rapidly expanding use of spray irrigation. Until recent years there has been almost complete dependence on natural stream flows, but the need for some regulating storages has become apparent. Increasingly, farmers are constructing storages of their own.

Underground water suitable for stock, minor irrigation works and domestic use is exploited in the consolidated rocks of southern, midlands and north-western Tasmania. In some coastal areas, notably King and Flinders Islands, water is obtained from aeolian sands.

The Mines Department is charged with the investigation of underground water resources. There is a great reserve of untapped permanent streams in the western half of the State, which is largely unsettled. The State's rivers discharge in the west, but diversion to the eastern half of the watersheds is not regarded as practicable.

### **Administration**

In Tasmania, water supply was once exclusively the responsibility of local government authorities, but three statutory authorities, the Hobart Regional Water Board, the Rivers and Water Supply Commission and the North West Regional Water Authority, now operate bulk supply schemes. While the Board is responsible for bulk supplies in the Hobart area, the Commission exercises a general control over the use of the State's water resources and the Authority controls water supply to a number of northern municipalities.

### **Rivers and Water Supply Commission**

The Commission is empowered by the *Water Act 1957* to take water at streams and lakes, or to issue others with licences to do so; licensing covers supply to specific industries and municipalities as well as for irrigation. The Commission is concerned with drainage trusts' operations, river improvements, irrigation, stream gauging, its own regional water schemes, and with assessing proposals for water supply, sewerage and drainage of towns. It operates in a similar manner to the Hobart Regional Water Board in controlling the water schemes serving the East Tamar region (North Esk Regional Water Supply), the West Tamar area (West Tamar Water Supply) and the Prosser River Scheme near Orford. The North Esk Regional Water Supply Scheme supplies industrial users at Bell Bay and municipalities on the eastern bank of the River Tamar. The West Tamar Water Supply serves the Beaconsfield municipality. The local government authorities retain primary responsibility for reticulation and sale to consumers, except to certain industrial users.

In municipalities not serviced by the Hobart Regional Water Board, the Rivers and Water Supply Commission or the North West Regional Water Authority, the supply of water is a function of the local municipal council.

### **Irrigation**

The Rivers and Water Supply Commission is in charge of three major irrigation schemes, these being the Cressy-Longford Irrigation Scheme (opened in 1974), the South East Irrigation Scheme, Stage I, (opened in 1986), both of which supply water via open channel, and the Winnaleah Irrigation Scheme which supplies water via pipelines.

Of the three schemes, Cressy-Longford is the largest (serving 88 properties) with 10,000 hectares being fit for irrigation. The Coal River Scheme is capable of serving 107 properties, of which 3,800 hectares are fit for irrigation. The Winnaleah Scheme serves 1,500 hectares on 72 properties.

The majority of land irrigated in the State in 1986-87 was watered by private schemes, either by pumping directly from unregulated streams or from on-farm storages. Pasture still predominates as the major crop irrigated, but other vegetables now constitute 33 per cent of the total area irrigated.

## **Northern Territory**

### **Administration**

Under the Northern Territory *Control of Waters Act 1981*, control of natural waters is vested in the Crown. The diversion of water is prohibited except under prescribed conditions. The Act requires that drilling for ground water be carried out only by drillers who are registered under the Act and who are required to provide the government with information on bores drilled. In particular areas, described as Water Control Districts, where stricter control is necessary, the construction or use of a well or water bore without a permit can be prohibited.

Under the *Water Supplies Development Act 1960*, any landholder engaged in pastoral or agricultural production may seek information or advice from the Commissioner of Water Development who is appointed under the Act.

The Water Resources Directorate of the Power and Water Authority is responsible for the assessment, planning and management of surface and groundwater resources throughout the Northern Territory. It carries out systematic stream gauging, the collection of data relating to the quantity and quality of surface and groundwater, flood prevention and control, and waste disposal and baseline inventory. It is involved in water pollution studies and control, and carries out environmental assessments of water and related developments. It also provides an advisory service under the *Water Supplies Development Act 1960* and administers permits and licences under the *Control of Waters Act 1981*.

These arrangements have applied since 1 July 1987. It is proposed that Northern Territory water legislation be amalgamated into a new Act to be called the 'Water Act'.

### **Surface water**

Hydrological investigations and data collection are undertaken across the Northern Territory and the data are published by the Water Resources Group. The program includes base stream gauging stations and pluviographs (automatic rainfall recorders).

## Groundwater

For information on Northern Territory groundwater (and surface water) resources see the Northern Territory Department of Mines and Energy's publication *Water Northern Territory—Volume 1*, the Department of Resources and Energy's publications *Australia's Groundwater Resources, 1983* and the Australian Water Resources Council's publication *1985 Review of Australia's Water Resources and Water Use*.

Of 19,596 bores and wells registered in the Territory to 30 June 1987, 24 per cent were for pastoral use, 24 per cent were investigation bores, 33 per cent served urban and domestic supplies, 4 per cent were for agriculture, 11 per cent were used for mining and the remaining 4 per cent for various other uses.

## Water supplies

The largest water conservation projects in the Territory are the Darwin River Dam (259.0 gegalitres) and the Manton Dam (15.7 gegalitres) which both serve Darwin with a reticulated water supply. Groundwater from McMinns Lagoon area can be used to augment supply.

Most other towns and communities, including Alice Springs, Tennant Creek, Jabiru and Nhulunbuy, are supplied from groundwater.

Irrigation in the Territory is expanding, but is not extensive, being confined to locations near Darwin, Adelaide River, Daly River, Katherine, Ti Tree and Alice Springs for the purpose of growing fruit, vegetables, fodder crops, pastures and some dairying. Most of this irrigation is carried out using bore water.

There is increasing demand for water resources assessment studies and assistance for relatively small irrigation projects.

## Australian Capital Territory

### Surface water

Surface water storages supplying A.C.T. (population about 250,000) and the city of Queanbeyan (population about 22,500) are located to the south-west and south-east. The storages to the south-west are in the heavily timbered, mountainous Cotter River catchment within the A.C.T., the storages being Corin Dam (75.5 gegalitres), Bendora Dam (10.7 gegalitres) and Cotter Dam (4.7 gegalitres). The storage to the south-east in New South Wales in the Queanbeyan River catchment (over which the Commonwealth has permanent water rights) on the western slopes of the Great Dividing Range is the Googong Dam (125.0 gegalitres).

The existing storages on the Cotter and Queanbeyan Rivers have an ultimate combined capacity to serve 450,000 persons. The remaining water resource within the A.C.T. is the Gudgenby River which is at present not utilised but has the potential to serve approximately 200,000 persons.

A network of stream gauging stations in the A.C.T. monitors surface water resources while a number of gauging stations are provided with telemeters to provide a flood warning system in association with the Bureau of Meteorology.

### Groundwater

Groundwater in the A.C.T. and environs occurs mainly in fractures in crystalline rock such as granite and volcanic rocks; in folded and fractured slate; and, rarely, in solution cavities in limestone. Alluvial aquifers of significance are restricted to the Lake George basin and small areas along mature sections of the Molonglo and Murrumbidgee rivers. Groundwater has been used in the past by most primary producers to augment surface storage. Groundwater production bores in the A.C.T. have yields ranging between about 0.4 and 20 KL per hour; 3 KL per hour is about the average yield. However, many farm bores have fallen into disuse as a result of the government's resumption of freehold land within the A.C.T., and because of the rapid expansion of urban growth. The Bureau of Mineral Resources has provided a bore-siting, groundwater-quality and yield-prediction service in and around the A.C.T. since the early 1950s and has maintained a network of observation bores which have been monitored regularly.

The Bureau of Mineral Resources provides technical advice to landholders and drilling contractors on groundwater and, occasionally, on runoff.

## DROUGHT IN AUSTRALIA

*(This special article has been contributed by the National Climate Centre, Bureau of Meteorology)*

The incidence of drought in Australia to 1968 was surveyed in the 1968 *Year Book* No. 54. The purpose of this article is to bring that survey up to date with information to 1986 inclusive. While broadly summarising the material from the earlier article, the most recent widespread and severe drought in Australia, the drought of 1982-83, is given a special mention. Developments in the Australian Drought Watch Service, operated by the Bureau of Meteorology, and in the monitoring of variations in the climate that can lead to drought are also briefly described.

### Definition of drought

Drought in general refers to an acute water shortage. However the term is relative because water availability, which depends on supply and demand, is affected by regional differences in both the climate and the activities of the water user. To a large extent, users adapt to a perception of what is the normal supply for an area but there are other differences. A farmer, for example, is concerned with insufficient water during a season for crops, pastures and stock. A civil engineer in the same area may be more concerned with longer term aspects associated with the storage and managing of water in a reservoir.

On the supply side of the drought equation the main determinants are meteorological and hydrological. It is the former that is given emphasis in this article. A comprehensive coverage of Australia's water resources, including the impact of drought, is given in the series of publications, *Water 2000* prepared for the Australian Water Resources Council in 1983. The broader subject of drought in Australia and the mitigation of its adverse effects has been the topic of many papers and symposia, for example, see the report and recommendations of a drought workshop held in Melbourne by the Royal Meteorological Society in 1986.

The amount of water available for the great majority of users depends on the storage, whether it be in the soil, farm dams, artesian basins, reservoirs and so on. In addition, water availability is affected by losses due to run-off, evaporation and wasteful usage. However the primary indicator of water availability in Australia is rainfall and, given its extensive measurement across the country, rainfall is the most suitable starting point to assess the incidence of drought.

One important aspect of rainfall or more specifically the lack of it, is the difference between aridity and drought, distinguished by Coughlan and Lee (1978) thus: *Aridity implies a high probability of rainfall for a given period below a low threshold. Drought implies a low probability of rainfall for a given period below a relatively low threshold.*

Thus establishing drought criteria is less meaningful for arid zones since the prospects of receiving useful rainfall are significantly lower there than in more abundant rainfall zones. During the dry seasons of the seasonal rainfall zones, e.g. northern Australia, the expectation of useful rainfall can also be quite low and one may think in terms of seasonal aridity. Defining drought criteria for areas with highly seasonal rainfall requires separate consideration and the problem of delineating the onset and retreat of drought in such areas can be quite complex.

### Pastoral drought and climatic zones

From a practical viewpoint then, drought is intrinsically related to climatic zones and to the resistance of plants to water shortages. Generally, natural pastures and herbage have evolved to become highly resistant to extended periods of low rainfall particularly in the arid zone. On the other hand, cereal crops such as wheat, being more sensitive to water limitations, require specific treatment in the establishment of criteria for drought.

There are many ways of delineating climatic zones. Those shown for Australia in the diagram on page 211 are based principally on seasonal rainfall characteristics, although evaporation has been taken into account to some extent in the derivation of the zonal boundaries (Bureau of Meteorology, 1975).

In the winter and uniform zones of Australia where agricultural and pastoral activities are more intensive, three consecutive months, although an arbitrary figure, has been found to be an appropriate minimum period for a significant deficiency in the rainfall to develop. Rainfall in the summer rainfall zone is generally more variable when compared with the winter and uniform zones. Coughlan and Lee (1978) have used the summer rainfall zone in northern Australia to illustrate how probabilities of water stress in sown crops may be affected by the expected variability within any one season. Native pastures, in contrast, have evidently evolved to respond more effectively to seasonal rainfall as a whole and are less likely to be affected by the distribution of variable quantities throughout the season. Soil type and the degree to which it has been worked are also significant factors in this regard.

Rainfall in arid zones, as well as being low, is usually highly variable in space and time, and natural pastures and herbage are strongly resistant to such stresses. Drought in an arid zone is generally more appropriate to longer periods, e.g. a year or more, rather than to periods as short as three consecutive months.

### **Rainfall deficiency and the Australian Drought Watch Service**

There have been many attempts to arrive at a satisfactory method of objectively defining drought, establishing criteria for its onset, monitoring its course and declaring a drought ended. Perhaps the most successful approach, and one of the simplest in concept, uses the first decile of accumulated rainfall for a given period as an indicator of drought (Gibbs and Maher, 1967; Lee and Gaffney, 1986). The first decile is simply that amount of rainfall which is exceeded on ninety per cent of occasions for the period of the year specified, e.g. winter, spring or indeed any period of consecutive months. The concept of rainfall deficiency employed by the Bureau of Meteorology is based on a comparison of the rainfall total for at least three months in a specific area with the historical long period record for those three or more months. Thus an area is categorised as having a rainfall deficiency when the rainfall for a period of at least three months falls within the lowest ten per cent (below the first decile) of the historically recorded rainfalls for the same period of the year.

The terms serious and severe rainfall deficiency are defined as follows:

- a *serious rainfall deficiency* exists for a specific period of three (or more) months when the rainfall is above the lowest five per cent of recorded rainfalls, but is less than the ten per cent value;
- a *severe rainfall deficiency* exists for a specific period of three (or more) months when the rainfall is among the lowest five per cent of recorded rainfalls.

When serious or severe deficiencies exist in an area they continue as such until:

- (a) rainfall for the past month is already sufficient to rank in the 30th percentile or greater of the recorded rainfalls for the three month period starting with that month (a break due to relatively heavy rainfall), or
- (b) rainfall for the past three months ranks in the 70th percentile or greater of the recorded rainfalls for the corresponding three month period (a break due to a series of lesser but overall significant falls).

Rainfall deficiency criteria based on decile values provide the basis for alerting to incipient drought and monitoring the course of extant drought. The procedures, which have been in use in Australia since 1965, have also been adopted by the World Meteorological Organization to monitor drought on a worldwide scale (World Meteorological Organization, 1985). The Drought Watch Service, operated by the National Climate Centre in the Bureau of Meteorology, uses rainfall data from around 800 individual stations throughout the country to provide a monthly statement supported by maps and figures on the distribution of existing rainfall deficiencies (Coughlan, 1986).

### **Major droughts in Australia**

Foley (1957), on the basis of rainfall analyses, classified major droughts in Australia from the early period of European settlement to 1955. He referred to these droughts, summarised in Table 1, as major, severe and widespread and his broad descriptive material indicates that each affected several States covering about one quarter of Australia or more, for varying

periods of one or more years. Some of these droughts could be described as drought periods consisting of a series of dry spells of various lengths, overlapping in time and space, and totalling up to about a decade, as in the case of the 1895–1903 drought.

Subsequent to Foley's work, major droughts in Australia have been assessed from time to time using rainfall decile analyses. Typically they have been described as areas of at least serious rainfall deficiency (below the first decile), collectively encompassing at least one quarter of Australia for periods in excess of 10 months. The drought period of 1958–68 and the drought of 1982–83 met these criteria.

TABLE 1: MAJOR DROUGHTS IN AUSTRALIA

| <i>Drought period (a)</i> | <i>Description</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1864–66 (and 1868)        | The little data available indicate that this drought period was rather severe in Victoria, South Australia, New South Wales, Queensland and Western Australia.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 1880–86                   | Victoria (northern areas and Gippsland); New South Wales (mainly northern wheat belt, northern tablelands and south coast); Queensland (1881–86, in south-east with breaks—otherwise mainly in coastal areas, the central highlands and central interior in 1883–86); and South Australia (1884–86, mainly in agricultural areas).                                                                                                                                                                                                                                                                     |
| 1888                      | Victoria (northern areas and Gippsland); Tasmania (1887–89 in the south); New South Wales; Queensland (1888–89); South Australia and Western Australia (central agricultural areas).                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 1895–1903                 | Practically the whole of Australia was affected but most persistently the coast of Queensland, inland areas of New South Wales, South Australia, and central Australia. This was probably Australia's worst drought to date in terms of severity and area. Sheep numbers, which had reached more than 100 million, were reduced by approximately half and cattle numbers by more than 40 per cent. Average wheat yields exceeded 8 bushels per acre in only one year of the nine, and dropped to 2.4 bushels per acre in 1902.                                                                         |
| 1911–16                   | Victoria (1913–15 in north and west); Tasmania (1913–15); New South Wales, particularly inland areas; Queensland; Northern Territory (mainly in the Tennant Creek–Alexandria Downs area); South Australia (some breaks in agricultural areas); and Western Australia (1910–14).                                                                                                                                                                                                                                                                                                                        |
| 1918–20                   | Queensland, New South Wales, South Australia, Northern Territory (Darwin–Daly Waters area and central Australia), Western Australia (Fortescue area), Victoria, and Tasmania.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 1939–45                   | New South Wales (severe on the coast), South Australia (persistent in pastoral areas), Queensland and Tasmania; also (more particularly in 1940 and 1944–45) in Western Australia, Victoria, and central Australia; Tennant Creek–Alexandria Downs area in 1943–45.                                                                                                                                                                                                                                                                                                                                    |
| 1958–68                   | This drought was most widespread and probably second to the 1895–1903 drought in severity. For more than a decade from 1957, drought was consistently prominent and frequently made news headlines from 1964 onwards. This was treated as one major drought period, but could be subdivided into two which overlapped, both in time and space. Central Australia and vast areas of adjacent Queensland, South Australia, Western Australia, New South Wales, and northern Australia were affected, with varying intensity, 1957–66; and south-eastern Australia experienced a severe drought, 1964–68. |
| 1982–83                   | This extensive drought affected nearly all of eastern Australia, and was particularly severe in south-eastern Australia. Lowest ever 11 month rainfall occurred over most of Victoria and much of inland New South Wales and central and southern Queensland; and lowest ever 10 month rainfall occurred in much of South Australia and northern Queensland. Total losses were estimated in excess of \$3,000 million.                                                                                                                                                                                 |

(a) Major droughts to 1939–45 were classified by Foley (1957). Subsequent droughts were classified by the Drought Watch Criteria (1986).

Australia's most severe drought periods since the beginning of European settlement appear to have been those of 1895–1903 and 1958–68. The 1982–83 drought was possibly the most intense with respect to the area affected by severe rainfall deficiencies. These periods were comparable in their overall impact, but differed appreciably in character.

The 1895–1903 drought period was probably Australia's worst to date, in terms of both its severity and area—affecting practically the whole of Australia at various times but more persistently in parts of eastern and central Australia. Stock and crop losses were apparently the highest in Australian history.

The 1958–68 drought period is described in the article contained in the 1968 *Year Book* No. 54. That drought period was widespread and probably second only to the 1895–1903 drought period in severity. The areas affected and their durations of drought were variable and overlapping.

The 1982–83 drought was notably severe also, especially in south-eastern Australia. This drought was monitored closely and is discussed more fully below.

Droughts of a lesser degree of severity categorised by Foley (1957) are given in Table 2. The droughts of 1970–73 and 1976 were analysed by rainfall deficiency methods based on decile analysis and are appropriate for inclusion in this category.

TABLE 2: DROUGHTS IN AUSTRALIA OF LESSER SEVERITY

| <i>Drought period (a)</i>     | <i>Description</i>                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1922–23 and 1926–29 . . . . . | Queensland (severe); New South Wales (intermittent); Western Australia (more particularly Fortescue: 1922–29); South Australia (mainly pastoral areas); central Australia (1924–29); Northern Territory (1926–29); Victoria (1925–27; severe in the north 1925–29) and Tasmania (1925–27, not continuous).                                                    |
| 1933–38 . . . . .             | Western Australia (severe in pastoral and northern agricultural areas); Queensland (breaks on the coast); Victoria (north and Gippsland); New South Wales (not continuous except on the northern tablelands); Northern Territory; South Australia (1935–36 in pastoral areas and 1938 in agricultural areas) and northern Tasmania (1935–37, not continuous). |
| 1946–49 . . . . .             | Queensland (central coast and highlands and central interior, elsewhere mainly in 1946); Northern Territory and New South Wales (mainly in 1946–47); Western Australia (more particularly in central agricultural areas, 1947–50), and northern Tasmania (1948–49).                                                                                           |
| 1951–52 . . . . .             | Queensland and Northern Territory; and Western Australia, especially pastoral areas (1951–54).                                                                                                                                                                                                                                                                |
| 1970–73 . . . . .             | Prolonged drought over the north-eastern goldfields of Western Australia and adjacent areas, caused by successive below average rainfall years.                                                                                                                                                                                                               |
| 1976 . . . . .                | Western New South Wales, most of Victoria and South Australia due to failure of autumn–winter rains; break in September 1976.                                                                                                                                                                                                                                 |

(a) The droughts to 1951–52 inclusive, were classified by Foley (1957). The subsequent droughts, 1970–73 and 1976, were classified by the Drought Watch Criteria (1986).

### Severe droughts in south-eastern Australia

South-eastern Australia is taken to include New South Wales, southern Queensland, Victoria, Tasmania and the settled parts of South Australia; it contains about 75 per cent of the nation's population, and major droughts affecting the region have a markedly adverse impact on the economy. Severe droughts in south-eastern Australia are usually caused by a failure of the winter–spring rains and may extend through summer to the following autumn.

A severe drought is defined here in general terms as a drought in which ten or more rainfall districts are substantially affected by rainfall deficiencies for eight or more months. The onset of drought is taken as the month in which rainfall drops below average, and which marks the start of a period with serious rainfall deficiencies (below the first decile) lasting three months or more. A drought is considered broken when rainfall meets the criteria defined previously.

TABLE 3: SEVERE DROUGHTS IN SOUTH-EASTERN AUSTRALIA

| <i>Drought period (a)</i> | <i>Area affected</i>                                                                                    | <i>Average duration and month of break</i>                                                                                                                                                                                                                    | <i>Descriptive remarks</i>                                                                                                                                             |
|---------------------------|---------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1888                      | Southern Queensland, most of New South Wales, Victoria, South Australia and parts of Tasmania           | 9-10 months to January 1889                                                                                                                                                                                                                                   | In parts of northern New South Wales, not broken until autumn 1889                                                                                                     |
| 1902                      | New South Wales, Victoria, parts of southern Queensland, South Australia and Tasmania                   | Victoria, South Australia and Tasmania: 9 months to December 1902<br>New South Wales and southern Queensland: 12 months to 1902                                                                                                                               | Considerable overlapping of affected areas                                                                                                                             |
| 1914-15                   | Victoria, New South Wales west of the tablelands, settled areas of South Australia and most of Tasmania | South Australia: 11-12 months to June 1915<br>Northern Victoria and New South Wales: 10-12 months to June/July 1915<br>Southern Victoria: 16 months to May/June 1915                                                                                          | Rainfall during 1913 also below average in parts of south-eastern Australia; and much of Victoria and western New South Wales had some relief in the summer of 1914-15 |
| 1940-41                   | Most of New South Wales, Victoria, South Australia and eastern Tasmania                                 | South Australia: 6 months to January 1941<br>Tasmania: 8-9 months to January 1941<br>Victoria: 11 months to January 1941                                                                                                                                      | Variable durations in New South Wales                                                                                                                                  |
| 1944-45                   | Most of New South Wales, Victoria and South Australia                                                   | South Australia and south-western Victoria: 4-6 months to summer 1944-45<br>Southern Victoria: 12 months to August 1945<br>Northern Victoria and southern New South Wales: 15-19 months to August 1945<br>Northern New South Wales: 15-17 months to June 1945 | Well below average rainfall in parts of South Australia in April-June 1945; and 1943 was also a dry year in parts of south-eastern Australia                           |
| 1967-68                   | Victoria, southern New South Wales, South Australia and Tasmania                                        | South Australia: 12-13 months to March 1968<br>Tasmania: 15-16 months to May 1968<br>Victoria and New South Wales: 14-15 months to May 1968                                                                                                                   | Other extensive parts of Australia affected during 1958-67                                                                                                             |
| 1972-73                   | Most of Victoria, western and central New South Wales, South Australia and north-eastern Tasmania       | 9-10 months ending February 1973                                                                                                                                                                                                                              | Drought broke in February 1973; except in north-eastern Tasmania, where it broke in autumn 1973                                                                        |
| 1982-83                   | Victoria, most of New South Wales, South Australia, southern Queensland and Tasmania                    | Generally 11 months ending February 1983<br>Tasmania: 9 months ending February 1983                                                                                                                                                                           | Drought broke in autumn 1983                                                                                                                                           |

(a) The drought periods prior to 1965 inclusive, occurring prior to the operation of the Drought Watch Criteria, have been re-assessed applying those criteria. The specified severe droughts in south-eastern Australia are actually encompassed within the major droughts in Australia contained in Table 1 (except 1972-73).

These past, severe droughts were investigated (Bureau of Meteorology, 1983) using seasonal rainfalls over south-eastern Australia based on a limited network of rainfall stations and previously published material. Droughts after 1914 were identified using also the district rainfall data. Two earlier droughts affected south-eastern Australia, in 1864-66 and 1880-86, but rainfall data for these are incomplete. The 1918-20 period was also significantly drought affected without quite meeting the criteria.

Of these eight severe droughts in south-eastern Australia, four ended in summer (1888, 1902, 1940-41, 1972-73). Two droughts (1967-68 and 1982-83) broke in autumn. The remaining two (1914-15 and 1944-45) generally persisted until the following winters, although there were useful summer rains over a significant portion of the drought affected areas.

### **The 1982–83 major drought**

The following figure indicates the severity and extent of the 1982–83 major drought in terms of rainfall deficiency over the extensive areas where rainfall for the duration of the drought, approximately ten to eleven months, was the lowest on record. This was due to a widespread failure of the winter and spring rains of 1982. By the end of February 1983, in this vast area of eastern Australia, only small parts of south-east Queensland, adjacent north-east New South Wales and parts of south-west and north-east Tasmania were free from drought.

In the far south-eastern part of the continent the drought was markedly severe. Virtually all of Victoria and southern New South Wales had registered record low rainfall for the eleven months, April 1982–February 1983 inclusive. Much of the settled areas of South Australia had recorded their lowest ever rainfall for the ten months, May 1982–February 1983 inclusive.

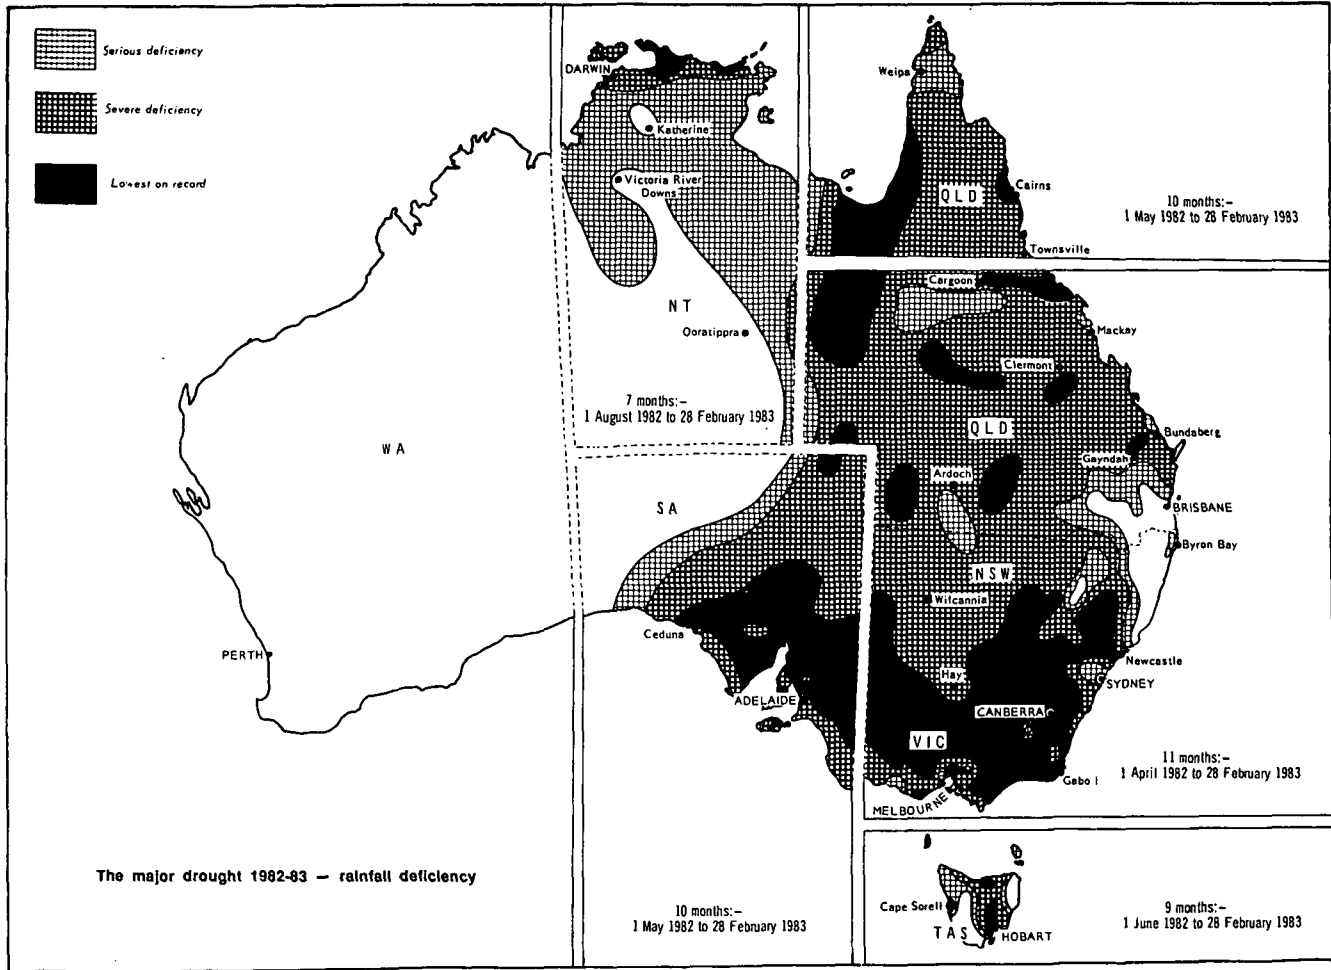

It is generally agreed that the widespread bushfires which culminated in the enormous conflagrations of Ash Wednesday, 16 February 1983, were a direct consequence of the preceding drought conditions. Total losses caused by the drought were estimated by the Australian Government to exceed \$3,000 million; and estimates of losses in south-eastern Australia exceeded \$1,200 million.

Widespread heavy rains in March 1983 significantly reduced the extent of the drought over eastern Australia. Heavy April rains further decreased the area of the drought, and record May rains left only small scattered remnants at the end of autumn 1983.

### **Physical causes of drought**

The physical causes of drought, as distinct from the socio-economic factors that may induce stress in association with below average rainfall (e.g. *see* Coughlan, 1985), have their origins in the fluctuations of the global climate system. There are many possible reasons why the weather during a particular month or season will differ from one year to the next. The climate system as a whole is an extremely complex mix of different sub-systems all interacting with each other on a wide range of time and space scales, e.g. the atmosphere, oceans, ice masses and the biosphere. The potential for variability from year to year and decade to decade therefore is very high. Given this high level of 'internal' variability, the significance or even the reality of possible external influences from sunspots, phases of the moon and so on, remains highly questionable on time scales shorter than millenia.

The fact that variability in time and space is an inherent character of the climate means that droughts of varying extent and severity must also be an inherent part of this variability. With an increase in understanding of how the various parts of the climate system fit together and interact with each other, is coming a greater understanding at least of what causes the larger scale droughts. Perhaps the most widely known climatic anomaly that has developed every few years is the so-called El-Nino phenomenon. El-Nino, a name given to an anomalous warm ocean current off the equatorial Pacific coast of South America is part of a much wider system affecting the whole of the Pacific Basin and probably the whole globe. The appearance of an El-Nino is very often associated with below average rainfall over much of eastern Australia. El-Nino is linked to a swing in the mean atmospheric pressure difference across the Pacific Ocean called the Southern Oscillation. Many of the widespread and severe droughts affecting eastern Australia identified above were a direct consequence of a marked swing in the Southern Oscillation.

---

## Monitoring the weather and climate

With a growing international awareness of the social and economic impacts of climate variability, including drought, the World Meteorological Organization (WMO) in the late 1970s instituted a World Climate Programme (WCP) to complement its long established World Weather Watch Programme. The WCP is the formal framework for international co-operation in climate data exchange, climate monitoring, applications of climate data, climate research and the impacts of climate variability on man and the environment. As a national focus, some countries (e.g. U.S.A. and Canada) have established National Climate Programs.

Australia's Bureau of Meteorology plays a key role in international data exchange and analysis by operating in Melbourne one of the three World Meteorological Centres (WMC), the other two centres being in Washington and Moscow. The Melbourne WMC and a Regional Meteorological Centre in Darwin, also operated by the Bureau, collect and process weather and climate data for the southern hemisphere. These Centres issue daily weather analyses and forecasts for the southern hemisphere, eastern Asia and the western equatorial Pacific.

The National Climate Centre (NCC), in addition to its monitoring of fluctuations in Australia's climate, carries out analyses of monthly and seasonal variations of atmospheric pressure, temperature and wind over the southern hemisphere as a whole. The analyses are contained in the NCC's monthly Climate Monitoring Bulletin accompanied by seasonal indications, outlooks and inferences when feasible. Information is regularly exchanged between similar climate centres operating in other countries.

The Bureau of Meteorology Research Centre has also instituted a program of research into the problems of forecasting climate fluctuations on monthly and seasonal time scales. Any improvements in this regard would have far reaching implications for our ability to cope with drought. Already there are signs of some skill in using the new found knowledge of the Southern Oscillation/El-Nino phenomenon to assess the likelihood of major anomalies in winter/spring rainfall over eastern Australia several months in advance.

## Conclusion

Since the 1860s there have been nine major Australian droughts. The major drought periods of 1895-1903 and 1958-68 and the major drought of 1982-83 were the most severe in terms of rainfall deficiency and their effects on primary production. In south-eastern Australia the droughts of 1967-68 and 1982-83 were notably extreme. There have been six other droughts of a lesser degree of intensity, but nevertheless causing appreciable losses in large areas of several States. In south-eastern Australia there have been eight severe droughts, mostly encompassed within the major Australian droughts.

Droughts will continue to be a prominent feature of the Australian scene. Improved meteorological drought watch services and hopefully an improved ability to forecast droughts through local research and participation in the WCP will help to mitigate their adverse impacts. The nature of drought, however, and the way in which the community should deal with it are complex issues incorporating significant variables in fields such as hydrology, agriculture, economics and sociology, as well as in the political realities of the day.

## CHAPTER SEVENTEEN

# ENERGY

### Introduction

Australia is well endowed with energy resources and is presently one of only five Organisation for Economic Co-operation and Development (OECD) countries that are net energy exporters. It presently supplies about two-thirds of its oil requirements from domestic sources and should be able to maintain this relatively favourable situation for some years at least.

Estimates of Australia's demonstrated economically recoverable resources of energy as at June 1986 were:

|                                         |                  |
|-----------------------------------------|------------------|
| Brown Coal . . . . .                    | 43 gigatonnes    |
| Black Coal . . . . .                    | 34 gigatonnes    |
| Uranium . . . . .                       | 462 kilotonnes U |
| Natural Gas . . . . .                   | 691 teralitres   |
| Crude oil, gas condensate and LPG . . . | 457 gigitalitres |

Additionally, there are huge inferred resources of black coal amounting to over 500 gigatonnes, and resources of oil shale equivalent to about ten times the level of crude oil and condensate resources.

In recognition of the importance of energy resources to Australia's national wealth, policies have been developed to respond to the changing pattern of world energy supplies, to try to minimise uncertainty for the future and to develop other energy sources which can substitute for oil in a wide range of uses, in both domestic and export markets. The basic aims of these policies are to:

- ensure that an adequate supply of energy is available at all times;
- in relation to liquid fuels,
  - achieve the optimum economic level of liquid fuels self-sufficiency through, for example:
    - .. encouraging the more efficient use of liquid fuels
    - .. replacing the use of oil by relatively abundant energy sources such as coal and natural gas
    - .. encouraging petroleum exploration and development;
    - .. supporting the development of technologies for alternative energy sources, particularly synthetic liquid fuels and renewables; and
  - prepare Australia for major interruptions to oil supplies through maintaining stocks, emergency-allocation schemes and other short lead-time measures;
- facilitate the efficient use of energy in Australia and the efficient development of Australia's energy resources in response to the needs of domestic and overseas energy markets;
- ensure that benefits of energy-resource development are shared equitably throughout the Australian community.

In addition, the Government has made a number of decisions on uranium policy which are of relevance to the determination of priorities for funding of Research Development and Demonstration (RD&D) projects in the nuclear area. Firstly, uranium mining will only be permitted at Nabarlek, Ranger and Olympic Dam. Secondly, development of further stages of the nuclear fuel cycle in Australia will not be permitted as the Government will not facilitate, or be otherwise involved in, uranium enrichment. However, the Government supports RD&D directed at improving radioactive waste management.

In establishing an appropriate framework within which Australia's energy industries can develop, the Government attaches key importance to the pricing and fiscal environment surrounding production, consumption and trade of Australia's energy resources. Realistic pricing of all energy resources is of fundamental importance in developing this framework.

The Government completed reviews of the crude oil marketing and taxation arrangements applying to the petroleum industry in mid-1987. Details of marketing, pricing and secondary tax arrangements are given on pages 639 and 640.

## **Advice and co-ordination**

### **Institutional arrangements**

The Commonwealth Minister for Primary Industries and Energy has portfolio responsibility for national energy policy matters, including the commercial development of hydrocarbon fuels and minerals.

The Department of Primary Industries and Energy provides advice to the Minister on energy policy and provides support for a number of advisory bodies including the National Energy Research Development and Demonstration Council (NERDDC), the Australian Minerals and Energy Council (AMEC), the National Oil Supplies Advisory Committee (NOSAC), the National Petroleum Advisory Committee (NPAC), the National Fuels Emergency Consultative Committee (NFECC), and the Australian Coal Consultative Council (ACCC).

It is also responsible for the implementation of action required from Australia's membership of the International Energy Agency (IEA) and for the national system of accounting for a control of nuclear materials under Australia's Agreement with the International Atomic Energy Agency (IAEA).

### **International Energy Agency—IEA**

The IEA was established in Paris in November 1974 as an autonomous institution within the framework of the OECD. Australia joined the IEA in May 1979.

The Agency carries out the International Energy Program and the Long Term Co-operation Program. These programs aim to:

- prepare member countries against risk of oil supply disruptions and share remaining supplies in the event of a severe oil shortfall;
- develop alternative energy sources and the more efficient use of energy through co-operative research and development programs;
- promote co-operative relations with other oil-producing and oil-consuming countries.

The main decision-making body of the IEA is the Governing Board. The Board meets as required at Ministerial level and several times a year at senior official level. The IEA has standing groups on Long Term Co-operation, the Oil Market, Emergency Questions, a Committee on Research and Development and an ad hoc group on International Energy Relations.

## **Research and development**

### **National Energy Research, Development and Demonstration Program—NERD&D**

The NERD&D Program has been established to stimulate the level of energy research, development and demonstration in Australia in line with government energy policy and priorities. Grants under the NERD&D Program are approved by the Minister for Resources, who is advised by the National Energy Research, Development and Demonstration Council. The Council consists of twelve members drawn from government, private industry and tertiary institutions. It is supported by six technical standing committees covering all major areas of energy technology. High priority areas include energy management, oil and gas exploration and recovery techniques, coal combustion, coal evaluation, coal mining productivity and safety, coal beneficiation, production of liquid fuels from natural gas and synthesis gas, and substitution of diesel oil and petrol by natural gas and LPG.

The NERD&D Program is administered by the Department of Primary Industries and Energy. From the start of the program in 1978 to June 1987, \$175.1 million had been committed to research projects undertaken by government, industry and universities.

Additional Commonwealth support for energy research and demonstration is provided through budget appropriations to Commonwealth agencies such as CSIRO, BMR, and ANSTO, and through Commonwealth funding of all Australian universities. The Commonwealth also provides an incentive for research and development through the 150 per cent tax deduction scheme and through the Grants for Industrial Research and Development Scheme.

---

## **Commonwealth Scientific and Industrial Research Organisation—CSIRO**

Energy research within the Institute of Energy and Earth Resources is carried out with the objectives of improving methods of locating, evaluating, defining and characterising Australia's energy resources and planning their development and effective use, consistent with the minimisation of environmental stresses. Divisions of the Institute engaged in energy research include Geomechanics, Energy Chemistry, Energy Technology, Fossil Fuels, Mineral Chemistry and Mineral Engineering. Research on certain renewable sources of energy is carried out at the Centre for Irrigation and Freshwater Research.

## **Australian Minerals and Energy Council—AMEC**

The Australian Minerals and Energy Council was established in April 1976 by agreement between State and Commonwealth mines and energy Ministers, replacing the former Australian Minerals Council. AMEC is principally a body for consultation on minerals and energy matters and provides a forum for Ministers to discuss policy issues of mutual concern and co-ordinate policy action. An AMEC advisory committee which is composed of the departmental heads or their nominees provides for officer level consultation and information exchange. AMEC establishes committees, sub-committees and working parties to undertake specific tasks and report back through its advisory committee as the need arises.

## **Australian Coal Consultative Council—ACCC**

The Australian Coal Consultative Council was established in March 1983 to review and report from time to time on the economic and structural problems of the industry. The Council is a tripartite body, chaired by the Minister for Primary Industries and Energy. Its membership comprises the New South Wales and Queensland Ministers responsible for the industry, coal mine proprietors and mining unions. The Australian Mining Industry Council and the ACTU have observer status.

An advisory committee, whose membership reflects that of the ACCC, meets frequently (approximately monthly) and reports to the ACCC and through it to the relevant Commonwealth and State Ministers.

## **National Oil Supplies Advisory Committee—NOSAC**

The National Oil Supplies Advisory Committee was formed in 1983 by the amalgamation of separate Commonwealth/industry and Commonwealth/State bodies set up during the period of tight oil supply in 1979. Representatives of the Commonwealth Government, State government energy authorities and major domestic oil producers and refiners meet about twice a year to review the situation and outlook for domestic and international oil supplies. Matters discussed include oil production, new oil and gas developments, imports, exports, stock levels, regional shortages, industrial relations, shipping, technical matters and government policies affecting the oil industry.

## **National Petroleum Advisory Committee—NPAC**

Membership of NPAC is drawn from agricultural, general aviation, fishing, manufacturing, mining, oil, shipping and transport industries, the trade union movement and motorists' organisations, as well as Commonwealth, State and Territory Governments. The Department of Primary Industries and Energy provides the Secretariat for NPAC. In accordance with the NPAC recommendations, the Commonwealth Government has enacted the *Liquid Fuel Emergency Act 1984* and established, with the States and the Northern Territory, the National Fuels Emergency Consultative Committee.

## **National Fuels Emergency Consultative Committee—NFECC**

The NFECC, chaired by the Commonwealth and comprising officials of the Commonwealth, States and the Northern Territory, was established in late 1983 to consult and advise governments on matters relevant to the preparation for, and detailed management of, a national liquid fuels crisis; and to act as the prime channel of consultation between governments in the event of such a crisis.

## Australian Nuclear Science and Technology Organisation—ANSTO

ANSTO was established as a successor to the Australian Atomic Energy Commission (AAEC) pursuant to the *Australian Nuclear Science and Technology Organisation Act 1987*. For more details, see Chapter 22, Science and Technology.

### Energy research and development statistics

Estimates of the expenditure on energy R & D carried out in Australia during 1984–85, and classified by energy objective, are presented in the table below.

The estimate of manpower resources devoted to energy R & D in Australia during 1984–85 was 2,851 man years. Of this amount, business organisations accounted for 1,033 man years, general government organisations for 937 man years, higher education organisations for 874 man years and private non-profit organisations for 8 man years.

More detailed statistics are contained in the ABS publication *Research and Experimental Development; All Sector Summary, Australia, 1984–85* (8112.0)

(a) Refers to R&D activity predominantly directed towards producing, storing, transmitting, utilising and conserving energy. (b) Excludes Private Non-profit sector. (c) The energy objective categories represent ultimate national needs rather than the immediate objective of the researcher or organisation performing the energy R&D. (d) The sector classification used is adapted from the guidelines specified by the OECD for use in the conduct of R&D studies. (e) In accordance with IEA practice, source of funds are classified as either industry or government. (f) Includes expenditure associated with overhead staff providing indirect services to energy R&D. (g) Excludes enterprises in ASIC Division A, i.e. enterprises mainly engaged in agriculture, forestry, fishing and hunting.

## Resources

### Black coal

Black coal is currently the largest source of primary energy in Australia. By world standards, in relation to present population and consumption, Australia is fortunate in the availability of easily worked deposits of coal. The country's main black coal fields are located in New South Wales and Queensland, not far from the coast and the main centres of population.

Australia's inferred resources of black coal are very large, amounting to over 500 gigatonnes (Gt). At 30 June 1986, Australia's proven resources of black coal were estimated to total 54 Gt of which 34 Gt were considered economically recoverable. These recoverable resources are located largely in the Sydney Basin in New South Wales and the Bowen Basin in Queensland. There are other coal-bearing basins in New South Wales and Queensland, while small deposits are being worked in Western Australia, South Australia and Tasmania. Australian saleable black coal production in 1986-87 was 149 Mt.

For further details relating to the production of black coal in Australia see Chapter 15, Mineral Industry. Details about the nature and age of black coal are given in *Year Book* No. 64.

### Brown coal

Australia's measured and indicated resources of brown coal are estimated at 43,300 Mt, located principally in Victoria's Latrobe Valley (39,700 Mt). Small deposits exist in other areas of south Gippsland, in south-eastern Victoria at Gelliondale and in the south-central region at Anglesea, Bacchus Marsh and Altona. Deposits are also known at many places along the southern margin of the continent, as far north as central Queensland. Large deposits are being tested in the Kingston area of South Australia, the Esperance area of Western Australia and at Rosevale in the north-east of Tasmania.

Because brown coal has a relatively low specific-energy value and high water content, its utilisation depends on large-scale, low-cost mining and negligible transportation costs in its raw state.

In Victoria, the brown coal industry has reached a high degree of sophistication in mining, on-site development for power generation, briquetting and char manufacture. Production of brown coal in Victoria during 1985-86 was 35 Mt. The brown coal deposits of the Latrobe Valley have been developed by the State Electricity Commission of Victoria (SECV) for the generation of electricity. By the end of 1985-86, about 915 Mt of raw brown coal had been mined.

## Petroleum

The prospects of further discoveries of petroleum in Australia are considered to be good, particularly in sedimentary basins off the north-west coast. Consistent with the existing pattern of discoveries, undiscovered oil is likely to be of the light, low sulphur type and more gas fields than oil fields should be found. Assessments by the Bureau of Mineral Resources, Geology and Geophysics indicate that there is a 50 per cent chance of finding at least another 286 gigalitres (GL) (1,800 million barrels) of crude oil in Australia. This compares with demonstrated economically recoverable resources of 242 GL (1,522 million barrels) and demonstrated sub-economically recoverable resources of 20 GL (126 million barrels) as at 31 December 1986.

### PETROLEUM RESOURCES (a) AS AT 31 DECEMBER 1986

(a) Based on the McKelvey classification which sub-divides resources in terms of the economic feasibility of extraction and their certainty of occurrence. (b) Demonstrated economic resources are resources judged to be economically extractable and for which the quantity and quality are computed from specific measurements and extrapolation on geological evidence. (c) Gas resource very small. (d) Demonstrated sub-economic resources are similar to demonstrated economic resources in terms of certainty of occurrence but are judged to be sub-economic at present. (e) Discrepancies between totals and sums of components are due to rounding.

## Crude oil and condensate

Indigenous production, at 31,503 megalitres (543 thousand barrels per day) of crude oil and condensate in 1986-87, was only 0.7 per cent less than the peak level production in 1985-86. Since 1984-85, new wells came on stream in the Bonaparte and Harriet basins while production from Amadeus and Cooper-Eromanga also increased. In 1986-87, production in Gippsland basin dropped by 5.1 per cent from the 1985-86 level.

Exports of crude oil and condensate in 1986-87 increased by 13 per cent compared with 1985-86 and at 5,702 megalitres, was only 2.0 per cent below the level of exports in the peak year 1984-85. During 1986-87, more than 84 per cent of the exported crude oil and condensate originated from Bass Strait. The main markets were U.S.A., Singapore and Japan.

## Liquefied petroleum gas

Liquefied petroleum gas (LPG) is a valuable co-product of oil and gas production and petroleum refining. The major constituents of LPG are propane, propylene and iso- and normal-butane, which are gaseous at normal temperatures and pressures and are easily liquefied at moderate pressures or reduced temperature. Operations involving LPG are expensive in relation to other liquid fuels because LPG has to be refrigerated or pressurised when transported and stored. LPG is an alternative transport fuel for high mileage vehicles in urban areas as well as a petrochemical feedstock and a traditional fuel.

Identified economically recoverable resources of LPG at June 1987 of 97,000 megalitres (ML) are concentrated in Bass Strait, the North West Shelf and the Cooper Basin.

Production of naturally occurring LPG in Australia in 1986-87 was 3,927 ML (2,878 ML Bass Strait and 964 ML Cooper Basin), virtually all being extracted from crude oil and natural gas from the Bass Strait fields. About 68 per cent of Australia's LPG production is exported (2,675 ML in 1986-87)—mainly to Japan. Domestic consumption of 2,038 ML in 1986-87 was met by 736 ML of product obtained from refineries with supply shortfalls being met by naturally occurring Bass Strait product and import.

(a) Naturally occurring.

## North West Shelf Project

On 2 August 1985, the Joint Venture Participants (JVP) announced the signing of formal sales contracts for the export of Liquefied Natural Gas (LNG) to Japan from the North West Shelf project. The project is the largest single resource development program ever undertaken in Australia. Exports are to commence in October 1989 and will build up to six million tonnes a year from 1995, under take or pay provisions, until 2008. It is expected that some \$50 billion, in dollars of the day terms, in export revenue will be generated. North West Shelf gas will be sold to five electricity and three gas utilities which supply a combined market of some 90 million people.

The project is estimated to have a total capital cost of \$12 billion, excluding LNG tankers. Of this, \$2,100 million has been spent by the JVP for the supply of natural gas to the domestic markets of south-west Western Australia and the Pilbara comprising the North Rankin 'A' platform, a 134 km submarine pipeline, the onshore domestic gas plant and associated site engineering services. The State Energy Commission of Western Australia (SECWA) also constructed a 1,500 km pipeline to service the domestic markets.

The second phase, the export of LNG, currently estimated to cost \$9.8 billion, includes on-shore LNG plant (\$3,500 million), two more off-shore production platforms, further drilling and pipelines, site engineering and the provision of infrastructure and housing in Karratha. Seven 125,000 m<sup>3</sup> LNG tankers (costing about \$1 billion) will also be required.

On 12 March 1985 it was announced that the domestic gas contracts had been renegotiated in order to alleviate a potentially serious revenue shortfall for SECWA. This involved, in part, the waiver by the Commonwealth of a proportion of its share of domestic gas royalties in favour of the State.

The National Liaison Group (NLG) on the North West Shelf was subsequently established to serve as a forum for the exchange of information with a view to increasing Australian content in contracts and purchase orders for the project. It comprises representatives of the Commonwealth and State Governments, trade unions and industry associations

together with the JVP. The Commonwealth Minister for Primary Industries and Energy is joint chairman with the Western Australian Minister for Minerals and Energy. The aim of the NLG is to maximise Australian content consistent with cost, quality and performance criteria. The fundamental principle is that Australian industry should have a full and fair opportunity to compete in tenders for the project.

The North West Shelf project is one of national significance, with the potential for major impact on Australia's international trading position.

### Oil shale

A description of the nature and location of Australian oil shale deposits was given in *Year Book* No. 67.

Major investigations into oil shale development have concentrated on the Condor, Rundle and Stuart deposits.

### Uranium

Australia has about 28 per cent of the Western world's low-cost uranium reserves. Deposits occur in the Northern Territory, Western Australia, South Australia and Queensland. The major use for uranium is as fuel in nuclear reactors. It is also used for power generation in atomic energy research programs.

Uranium was first discovered in Australia in 1894 but systematic exploration did not begin until 1944 following requests from the United Kingdom and United States Governments. A number of significant deposits were identified, particularly in the Katherine/Darwin region of the Northern Territory and the Mt Isa/Cloncurry region in Queensland. This initial phase of exploration activity was from 1944 to the late 1950s, reaching a peak in 1954.

In the period from 1954 to 1971, about 9,120 tonnes of uranium oxide concentrate was produced from five plants at Rum Jungle, Moline and Rockhole in the Northern Territory, Mary Kathleen in Queensland and Radium Hill in South Australia. Uranium requirements for defence purposes decreased in the early 1960s, causing uranium demand and prices to fall rapidly, and exploration for uranium virtually ceased.

A revival of interest in the late 1960s was encouraged by the announcement of a new export policy in 1967, designed to encourage exploration for new uranium deposits while conserving known resources for future needs in Australia. The renewed activity which followed was very successful—major discoveries were made in South Australia: Beverley (1969), Honeymoon (1971), Olympic Dam (1975); in the Northern Territory: Ranger (1970), Nabarlek (1970), Koongarra (1970), Jabiluka (1971); and in Western Australia: Yeelirrie (1970). These and other discoveries have led to substantial additions to Australia's reasonably assured uranium resources which, at June 1986, totalled 462,000 tonnes of uranium recoverable at less than \$US80 per kg U.

Commercial production at the Ranger mine commenced in 1981 at a planned rate of 3,000 tonnes  $U_3O_8$  per annum. Plans are in progress to expand production to 4,500 tonnes per annum by 1989, with a further increase to 6,000 tonnes two or three years later. The Nabarlek deposit was mined in 1979 and the ore was stockpiled for later treatment. Production at a planned rate of 1,000 tonnes  $U_3O_8$  per annum, commenced in 1980 and is scheduled to end in 1988. Total production to the end of June 1987, as reported by the mine operators amounted to:

Ranger—18,010t  $U_3O_8$

Nabarlek—9,707t  $U_3O_8$

The Olympic Dam mine received development approval in early 1984 and construction of the mine was undertaken in 1986. Production of uranium is scheduled to commence during 1988 at a planned rate of 2,000 tonnes  $U_3O_8$ . The mine will also produce copper and gold.

The Australian Government's uranium policy permits exports of uranium from only the Ranger and Nabarlek mines in the Northern Territory and the Olympic Dam mine in South Australia.

All exports of Australian uranium will continue to be subject to the most stringent safeguards. Uranium produced in Australia is exported in the form of yellowcake for use in nuclear reactors for the generation of electricity and for the production of radioisotopes and radio pharmaceuticals.

Production of uranium for 1986 was 4,899 tonnes  $U_3O_8$  and exports were 4,164.5 tonnes valued at around \$373 million. The *Nuclear Non-Proliferation (Safeguards) Act 1987* gives domestic effect to Australia's international nuclear non-proliferation obligations which require domestic legislation. The legislation establishes a system of permits for the possession and transport of nuclear material (defined to cover uranium, thorium and plutonium), and other physical items such as equipment and material used in nuclear reactors. The permit and related provisions also deal with the possession and communication of sensitive information about nuclear technology, in circumstances where that information is not already a matter of public record. The legislation is administered by the Australian Safeguards Office.

## Thorium

Thorium is a radioactive mineral that is about three times as abundant as uranium, but occurs in fewer geological environments and in lower grade accumulation. Most of the world's resources of thorium occur in monazite, a complex phosphate recovered primarily for its rare-earth content. Primary thorium minerals are resistant to oxidation and form economically important placer deposits as well as hard-rock deposits.

In Australia, monazite is produced from titanium-bearing mineral sands on the east and west coasts. Other thorium occurrences are known, but are uneconomic. Australia presently supplies about 65 per cent of the world's traded monazite. Exports from Australia of thorium and thorium-containing ores require the approval of the Minister for Primary Industries and Energy under the Customs (Prohibited Exports) Regulations.

## Solar energy

Solar energy, like wind, tidal and wave energy is, for all practical purposes, inexhaustible and shares with these other energy sources a number of properties which, in general, make it difficult and costly to collect, store and transform into useful work. These inherent characteristics include a relatively low energy intensity and a variation in the availability of the supply arising from geographic, seasonal and daily effects.

Nevertheless, for specific applications such as domestic water and space heating, solar energy is already beginning to play a valuable role in Australia. Some 5 per cent of Australian residences have a domestic solar water heater with the local industry currently producing around 30,000 units annually. The use of passive solar design principles in housing is also increasing as low-cost passive designs are developed.

The best prospects for using many solar energy technologies are in areas of Australia remote from the major electricity grids, where electricity costs can be anywhere from 3 to 20 times those in metropolitan areas. Photovoltaic (solar) cells are being used to meet the electrical requirements of remote telecommunication repeater stations, navigational buoys, water pumps and homestead-scale power supply systems. A locally-developed transportable photovoltaic power supply system has been designed to meet the lighting, refrigeration, communication and water pumping requirements of a small community.

Researchers at the University of New South Wales have developed techniques for producing photovoltaic cells with an energy conversion efficiency of 19 per cent using commercial grade silicon material. In contrast, the efficiency of commercially available photovoltaic cells typically does not exceed 14 per cent.

## Wind energy

Using data from the Bureau of Meteorology wind stations, CSIRO has undertaken a continental wind assessment of Australia. In addition, a number of site specific wind resource assessments have been undertaken by CSIRO and other bodies. Broadly, these studies indicate that while the bulk of the Australia's inland has relatively low wind speeds, some coastal and island localities have good wind energy resources, notably on the Western Australian, South Australian and Tasmanian coasts, in Bass Strait and on Lord Howe Island.

At present the use of wind energy in Australia is confined principally to mechanical windmills for water pumping and small wind turbine generators for remote areas. It is unlikely that, in the short to medium term, wind energy will be able to compete on a widespread and large scale with coal for electricity generation in Australia. However, wind turbines could find increasing application in remote areas where wind resources are favourable and which currently rely on diesel fuel for electricity production.

Four imported wind turbines in the 20–55 kW range have been demonstrated in Western Australia and Victoria, with two of the machines on Rottnest Island, one at Fremantle and one at Ballarat. A large, imported 150 kW wind turbine is located at Malabar headland in the eastern suburbs of Sydney.

Locally manufactured wind turbines in the 30–60 kW range are also operating in Australia including a group of six at Esperance which form the basis of Australia's first wind farm. Electricity produced by the wind farm is used to supplement that provided to the Esperance grid by diesel generators.

### **Geothermal energy**

The most intensive and well-documented study in Australia of subsurface temperatures has been made using bore holes in the Great Artesian Basin. In this basin, about 20 per cent of the indexed bore holes penetrate to depths greater than 1,000 metres and, since the thermal gradients are generally above 30°C per 1,000 metres, it is reasonable to assume that hot water can be obtained from such aquifers. However, of the total number of indexed bores, only a very small proportion have water temperatures exceeding 100°C.

In general, it appears that cost constraints will largely restrict the use of our geothermal resources to the supply of hot water for space heating and light industrial purposes. However, for remote homesteads and communities in areas of the Great Artesian Basin, hot artesian bores may well be used to provide an economically viable alternative source of electricity to that obtained from diesel generators.

An Australian company has developed an organic rankine cycle heat engine which can utilise low grade sources of heat (80–100°C) to generate electricity. A 20 kW version of the engine has been used as the basis for Australia's first geothermal power plant at Mulka Station in the north-east of South Australia. There are also plans to construct a larger scale power plant (120 kW) at Birdsville in Queensland.

### **Ocean energy**

A number of potential energy sources are associated with the world's oceans, including mechanical energy in waves and tidal action and thermal energy absorbed by ocean waters.

Tidal energy is a dispersed energy source derived from regular fluctuations in the combined gravitational forces exerted by the moon and the sun at any one point on the earth's surface as the earth rotates. The mean tidal range in the open ocean is about one metre, but under suitable hydraulic and topographical conditions, much higher tides than this can build up in coastal locations.

Theoretically, around Australia there are very large amounts of tidal energy available, especially on the north-west coast where the tidal range is as great as 11 metres. Studies into prospective tidal power-plant sites in north-western Australia were conducted in 1965 and 1976. The 1976 study concluded that, at that time, the cost of generating electricity at this location would be more than three times the cost of electricity generated by a coal fired power plant. This estimate did not take into consideration the significant costs which would be involved in the transmission of electricity produced by the tidal plant to population centres.

Waves are generated by the interaction of the wind with large bodies of water. The amount of energy transferred depends on the wind speed, the distance over which it interacts with the water, and for how long the wind blows. There are plans by a local company to establish the world's largest wave power plant at Esperance in Western Australia. It is envisaged that the plant will have a capacity of 1 MW and will be used to supplement the existing Esperance electricity supply which is provided by diesel generators and a wind farm.

The temperature difference between the surface of the ocean and water located at depth can be as high as 25°C, particularly in equatorial regions (20°S to 20°N). Power cycles can be devised to operate between these temperature differences, thereby providing a source of electricity. No ocean thermal energy conversion systems are ready for commercialisation at this time.

### **Biomass**

Biomass includes crops, wood, agricultural and forestry residues, and animal wastes. Currently, only two forms of biomass are used significantly as energy in Australia. These are firewood and bagasse, both converted to energy by direct combustion.

Approximately 5.5 megatonnes of firewood are currently used annually in Australia, equivalent in energy terms to about 86 petajoules, or 2.5 per cent of Australia's total energy consumption. This proportion of consumption is expected to remain stable through the 1980s.

Bagasse is the fibrous residue remaining after extraction of the juice from sugar cane. It is the major fuel used in the sugar industry, providing about 71 petajoules, or 2.1 per cent of Australia's total energy consumption.

Biomass also has a possible use as a source of liquid fuels for transport, particularly ethanol and methanol. In 1979, the CSIRO completed a survey of the potential for the production of these fuels from agricultural and forestry resources in Australia. The resources considered were both new energy crops and forest plantations, as well as the residues from existing crop and forest production. In estimating potential new crop production, it was assumed that all land with suitable climate, soil and terrain for an energy crop would be available for energy farming except land at present under crops or sown pastures. The total biomass resources considered could provide a net liquid fuels output of 460 petajoules, or about 46 per cent of energy currently used as liquid fuel in road transport vehicles and off-road vehicles (e.g. agriculture, mining and construction equipment). This is a net figure, taking into account the liquid fuel used in production. It does not take into account socio-economic considerations such as more profitable or socially desirable use of the land available for new crops, and must be considered as an upper limit only.

Although technologies have been developed to convert biomass to liquid fuels, studies have shown that liquid fuel derived from biomass is not competitive with petroleum-based fuels at this stage.

### Crude oil marketing and pricing arrangements

After a review in the first half of 1987 of the marketing arrangements for Australian crude oil, the Government completely deregulated crude oil marketing with effect from 1 January 1988. The review began with the issue in February 1987 of a discussion paper, *Marketing Arrangements for Indigenous Crude Oil*, and took account of the views of the industry, State governments, and trade unions.

Deregulation allows refiners and all crude oil producers to negotiate freely the quantities and prices of crude oil they buy and sell, without government involvement. The decision to deregulate means:

- There is no longer any obligation on refiners to absorb particular quantities of Australian crude oil under the allocation system which had been in operation, in various forms, since 1965.
- The Government no longer fixes an Import Parity Price (IPP) for such crude purchased under the pricing system which had been in operation since 1978. The IPP was calculated on the basis of the replacement cost of Australian crude oils with imported crudes, with appropriate adjustments for freight costs and quality differentials.
- The Bass Strait Coastal Freight Adjustment Scheme, in operation since 1984, which placed a levy on allocated Bass Strait crude oil for redistribution among refiners as compensation for differential shipping costs, is no longer in operation.

Crude oil producers also gained complete freedom to export crude oil, as an alternative to selling on the domestic market, except in time of emergency. This is subject to other relevant government policies.

The move to a free market, together with crude oil excise concessions announced on 4 June 1987, optimises future crude oil self-sufficiency consistent with the efficient allocation of resources and places the industry on a competitive footing.

### Secondary tax arrangements in the petroleum industry

In addition to general taxation arrangements applying to companies in Australia, petroleum production projects are subject to secondary taxes. The type and rate of secondary taxation (resource rent tax, resource rent royalty, or excise and royalties) depends on the location of the petroleum resource, the date of discovery of the petroleum reservoir and the date upon which production commenced.

A *Resource Rent Tax* (RRT) applies to petroleum projects in the majority of Australia's offshore areas beyond the States' territorial seas. Excluded are the Bass Strait and North West Shelf production licence areas and associated exploration permits. Where RRT applies, it replaces excise and royalties which would otherwise have been levied.

A *Resource Rent Royalty* (RRR) policy applies to onshore petroleum projects and provides for the Commonwealth to waive its crude oil excise whenever the relevant State government negotiates an acceptable RRR agreement with the project producers and agrees to a satisfactory revenue sharing formula with the Commonwealth.

*Excise* applies to crude oil production from the Bass Strait and North West Shelf projects offshore and all onshore areas (except Barrow Island where a RRR applies). Excise also applies to LPG produced from offshore projects.

Crude oil excise is based on the annual level of crude oil sales from individual production areas and is levied as a percentage of the realised price received by producers.

Different excise scales are applicable to oil production depending upon the date of discovery of the production area and the date when the area was first developed. In the case of new offshore projects to which excise and royalty apply, and all onshore fields, the first 30 million barrels of crude oil production are exempt from excise. Production beyond this level is subject to the appropriate excise rate.

Oil discovered before 18 September 1975 ('old' oil) attracts a higher rate of excise than oil discovered on or after this date ('new' oil). An 'intermediate' scale also applies to oil produced from 'old' oil production areas that were not developed as of 23 October 1984. However, in the case of all onshore fields that commenced production after 1 July 1987, production in excess of 30 million barrels is subject to 'new' oil excise.

A *Commonwealth Royalty* is also levied on offshore petroleum production except in the case where RRR applies. Proceeds are shared on a 40:60 basis by the Commonwealth and the appropriate State or Territory. Thus, Victoria receives a share of the royalty from petroleum produced from Bass Strait, and Western Australia receives a share of the royalties from the North West Shelf. Onshore petroleum rights are vested in the State and Northern Territory Governments and the Commonwealth does not generally receive a share of this royalty.

### **Pricing of liquefied petroleum gas—LPG**

The Commonwealth Government sets the price that producers receive for LPG sold for automotive and traditional domestic, commercial and industrial uses. The current pricing arrangements for naturally-occurring and refinery-produced LPG were introduced on 1 November 1986 following a review of LPG pricing policy. Under these arrangements, adjustments to the maximum wholesale price are made on 1 October and 1 April each year. The price is determined at \$20 a tonne above the average export parity price of Bass Strait propane for the six-month period ending on the last day on the previous August for the 1 October adjustments, and the last day of the previous February for the 1 April adjustments. These arrangements do not apply to non-traditional commercial, industrial and petrochemical uses or exports. In these areas the price is determined by commercial negotiation.

### **Reticulated energy**

The two main forms of energy reticulated throughout Australia are gas, of which almost 98 per cent is natural gas; and electricity, the majority of which is generated by coal-fired thermal power stations.

### **Electricity and gas establishments in Australia**

The census of electricity and gas industries covers distribution as well as production and is conducted as a component of the Australian Bureau of Statistics' integrated economic statistics system. This system has been developed so that data from each industry sector conform to the same basic conceptual standards, thereby allowing comparative analysis between and across different industry sectors. The results of this census are therefore comparable with economic data collections undertaken annually for the mining and manufacturing industries and periodically for the retail and wholesale trade, construction, transport and selected services industries.

The following table shows a summary of operations of electricity and gas establishments for 1984-85. Further details are available in the publication *Electricity and Gas Establishments: Details of Operations, Australia 1984-85* (8208.0).

## ELECTRICITY AND GAS ESTABLISHMENTS—SUMMARY OF OPERATIONS, 1984–85

| State or Territory                | Establishments at 30 June | Employment at 30 June |         |        | Wages and salaries | Turnover | Stocks  |         | Purchases, transfers in and selected expenses | Value added | Fixed capital expenditure less disposals |
|-----------------------------------|---------------------------|-----------------------|---------|--------|--------------------|----------|---------|---------|-----------------------------------------------|-------------|------------------------------------------|
|                                   |                           | Males                 | Females | Total  |                    |          | Opening | Closing |                                               |             |                                          |
|                                   |                           | No.                   | No.     | No.    | \$m                | \$m      | \$m     | \$m     | \$m                                           | \$m         | \$m                                      |
| New South Wales—                  |                           |                       |         |        |                    |          |         |         |                                               |             |                                          |
| Electricity . . . . .             | 34                        | 27,222                | 2,807   | 30,029 | 711.5              | 4,374.7  | 358.8   | 313.1   | 2,494.5                                       | 1,834.5     | 979.8                                    |
| Gas . . . . .                     | 20                        | 2,213                 | 580     | 2,793  | 55.9               | 431.7    | 30.8    | 25.0    | 271.6                                         | 154.4       | 37.0                                     |
| Queensland—                       |                           |                       |         |        |                    |          |         |         |                                               |             |                                          |
| Electricity . . . . .             | 11                        | 10,918                | 1,501   | 12,419 | 293.2              | 1,869.1  | 142.4   | 117.9   | 991.5                                         | 853.2       | 589.4                                    |
| Gas . . . . .                     | 7                         | 619                   | 133     | 752    | 15.6               | 97.4     | 8.3     | 8.0     | 48.3                                          | 48.8        | 5.9                                      |

| Gas . . . . .                     | 34                        | 8,788                 | 1,729   | 10,517 | 229.4              | 1,655.2  | 71.8    | 70.0    | 828.5                                         | 825.0       | 384.1                                    |

(a) At the end of June 1985 the number of establishments were: Victoria—electricity 14, gas 1; South Australia—electricity 13, gas 2; Western Australia—electricity 6, gas 2; Tasmania—electricity 2, gas 1; Northern Territory—electricity 2 and Australian Capital Territory—electricity 1, gas 1.

## Electricity

Responsibility for public electricity supply rests with the State governments, which control electricity production and distribution through public authorities. The Commonwealth Government's major direct role in the electricity supply industry is its responsibility for the Snowy Mountains Scheme.

### Hydro-electric resources

With the exception of Tasmania, Australia is generally not well-endowed with hydro-electric resources because of low average rainfall and limited areas of high relief. Major hydro-electric potential is confined to Tasmania and the Great Dividing Range areas of Victoria, New South Wales and Queensland, with some small potential on rivers draining into the Timor Sea in Western Australia and Northern Territory.

The practical potential of hydro-electric power in Australia has been estimated at 24,000 gigawatt hours (GWh) per year, of which about 60 per cent has currently been developed. In 1985–86, hydro-electric generation was 14,917 GWh.

At 30 June 1986 the installed hydro-electric generating capacity of 7,028 megawatts (MW) represented 21 per cent of total installed capacity.

Future hydro development will be mainly limited to environmentally acceptable sites in Tasmania and, to a lesser extent, North Queensland, as most of the low cost resource elsewhere has already been developed. Although hydro-electric power stations will continue to be constructed into the 1990s and probably beyond, hydro's share of total generation will decline as increasing load is met mainly by coal-fired power stations.

### Snowy Mountains Hydro-Electric Scheme

The Snowy Mountains Scheme is a dual purpose complex which supplies water for generation and irrigation. It is located in south-eastern Australia, and on its completion was one of the largest engineering works of its type in the world. It impounds the south-flowing waters of the Snowy River and its tributary, the Eucumbene, at high elevations and diverts them inland to the Murray and Murrumbidgee Rivers through two tunnel systems driven through the Snowy Mountains. The scheme also involves the regulation and utilisation of the headwaters of the Murrumbidgee, Tumut, Tooma and Geehi Rivers. The diverted waters fall some 800 metres and together with regulated flows in the Geehi and Tumut River catchments generate mainly peak load electricity for the States of New South Wales, Victoria and the Australian Capital Territory as they pass through power stations to the irrigation areas inland from the Snowy Mountains.

A special article on the scheme appeared in the Energy Chapter of *Year Book* No. 70.

### Electricity generation and transmission

The following table shows details of thermal and hydro electricity generated in Australia during recent years.

#### ELECTRICITY (a)—THERMAL AND HYDRO

| Year              | <i>Million<br/>kWh</i> |
|-------------------|------------------------|
| 1980-81 . . . . . | 100,782                |
| 1981-82 . . . . . | 104,975                |
| 1982-83 . . . . . | 105,933                |
| 1983-84 . . . . . | 111,696                |
| 1984-85 . . . . . | 119,188                |
| 1985-86 . . . . . | 124,369                |

(a) Figures represent estimates of total electricity generated by public utilities, factories generating for their own use, and factories supplying electricity for domestic and other consumption.

### Gas

Natural gas was not discovered in any quantity until the 1960s. Before then, coal gasification was Australia's main source of reticulated gas. Over the past 20 years about 7,500 km of pipeline have been laid to link the gasfields with the major mainland metropolitan and urban centres. The distribution networks within these centres encompass a further 50,000 km of mains which supply about 2 million domestic, commercial and industrial customers Australia wide.

Whereas in the electric power industry almost all utilities are in the public sector, gas reticulation is a mixture of public and private enterprise with significant interstate activity. More details are provided within the State segments following.

### New South Wales

#### Department of Energy

As part of a broader restructuring of the State's energy supply industries, the Energy Authority of New South Wales was abolished and a new Department of Energy created on 1 July 1987 under the provisions of the *Energy Administration Act, 1987*. The new Department continues the activities of the former Energy Authority and has added roles and functions in relation to the electricity councils and the Electricity Commission.

The legislation confers broad powers on the Department to co-ordinate and develop the public electricity supply industry. The functions of the Department include the promotion of the wise use of electricity, especially its use for industrial and manufacturing purposes and for primary production. Guidelines are given to electricity supply authorities on various aspects of their activities such as the framing of electricity tariffs, public lighting and the standardising of materials and equipment.

The Department administers the Special Assistance Scheme, which provides subsidies to electricity supply authorities to assist them to maintain their supply system and to implement various tariff rationalisation measures introduced by the State government. The subsidy in 1986 amounted to \$32.75 million.

The Department of Energy continues to administer the Rural Electricity Subsidy Scheme which terminated on 30 June 1982. Under the scheme, the rural electrical development of the State has now been virtually completed in areas where the extension of supply is economically feasible. Electricity supply authorities receive subsidies towards the cost of new rural lines. At 30 June 1987, the scheme was committed to the payment of \$46,924,963 in subsidies, of which \$43,566,598 had been paid.

The Traffic Route Lighting Subsidy Scheme provides for financial assistance to councils towards the cost of installation of improved lighting on traffic routes traversing built-up areas with the objective of reducing the incidence of road accidents at night.

#### Electricity Commission of New South Wales and electricity supply authorities

The main function of the Commission is the generation and transmission of electricity, which it sells in bulk to distributing authorities (mainly local government bodies) throughout a large part of the State, to the government railways and to certain large industrial consumers.

As the major generating authority, it is also responsible for the development of major new power sources except in the Snowy Mountains region.

The retail sale of electricity to the public is, in general, carried out by separate electricity supply authorities. At 30 June 1986 there were 26 retail supply authorities throughout the State, comprising 23 electricity county councils (consisting of groups of shire and/or municipal councils), 1 city council, 1 shire council, and 1 private franchise holder.

#### **Generation and transmission**

Of the State's electrical power requirements during the year ended 30 June 1986, almost all was generated in New South Wales (over 93 per cent by six major thermal power stations and the balance from the Snowy Mountains Hydro-Electric Authority and other hydro-electric stations). Interchange with other States and other small generating authorities in New South Wales was negligible.

At 30 June 1986 the major power stations of the State system of the Electricity Commission of New South Wales and their effective capacities were as follows: Bayswater (Hunter Valley), 1,980 MW; Liddell (Hunter Valley), 1,840 MW; Munmorah (Tuggerah Lakes), 1,200 MW; Vales Point (Lake Macquarie), 1,890 MW; Eraring (Lake Macquarie), 2,648 MW; and Wallerawang (near Lithgow), 1,030 MW. The total nominal capacity of the Electricity Commission's system as at 30 June 1986 was 11,520 MW. The greater part of the Commission's generating plant is concentrated within a 185 km radius of Sydney.

Several local government bodies operate their own power stations and generate a portion of their requirements which is supplemented by interconnection with the system of the Electricity Commission. The aggregate effective capacity for the whole of New South Wales systems and isolated plants was approximately 11,555 MW at 30 June 1986 while the number of ultimate consumers at this date was 2,251,361.

The retailing of electricity to 97 per cent of the population of New South Wales is in the hands of local distributing authorities, which obtain electricity in bulk from the Commission's major State network. This network of 500 kV, 330 kV, 220 kV, 132 kV, 66 kV and some 33 kV transmission lines links the Commission's power stations with the load centres throughout the eastern portions of the State, extending geographically over 650 kilometres inland.

#### **New development**

Bayswater Power Station, which is situated in the Hunter Valley, was completed in 1987. It has a total capacity of 2,640 MW. Two 660 MW units are being installed at Mount Piper Power Station which is located on the western coalfield near Wallerawang. Commissioning of the Mount Piper station is planned for the early 1990s.

Construction of a double circuit 500 kV transmission line between Eraring and Kemps Creek, west of Sydney is complete. A double circuit 500 kV transmission link operating initially at 330 kV has been constructed from Bayswater Power Station to Mount Piper Power Station. An extension to Marulan is planned to interconnect with the existing transmission system between the Snowy Mountains and Sydney.

#### **Hydro-electricity**

The greater part of the hydro-electric potential of New South Wales is concentrated in the Snowy Mountains area (see page 641). Apart from this area, major hydro-electric stations are in operation at the Warragamba Dam (50 MW) and Hume Dam (50 MW). In addition, there are five smaller hydro-electric installations in operation in various parts of the State. A pumped-storage hydro-electric system to produce 240 MW has been installed as part of the Shoalhaven Scheme in conjunction with the Metropolitan Water Sewerage and Drainage Board.

#### **Gas reticulation**

Natural gas (NG) was made available to Sydney consumers with the completion of an overland supply pipeline from the Moomba field in South Australia in 1976. During the following five years, lateral pipelines were completed to Wollongong (1978), Bowral-Mittagong (1979), Goulburn (1980), and Canberra, Queanbeyan and Wagga Wagga (1981). A major trunk line between Sydney and Newcastle was completed in 1982.

With the connection of natural gas pipelines into existing reticulation systems, the use of manufactured (usually coal) or petroleum gas is gradually being superseded in the main

population centres of the State. By the end of 1986, more than half the Sydney homes with reticulated gas supply had been converted to the direct use of natural gas, with this program being scheduled for completion in 1991. At December 1986 Sydney users of direct natural gas totalled about 237,000 residential and 141,000 other (mainly commercial/industrial).

A smaller number of regional centres not yet connected to the natural gas distribution network still retain their own manufactured gas production and reticulation systems. These systems are operated either by local government or by commercial interests. However, together they account for less than 3 per cent of total sales in New South Wales.

The total amount of gas (all types) available for issue through mains in New South Wales was 81,725 terajoules in 1984-85, 92,532 terajoules in 1985-86 and 93,689 terajoules in 1986-87.

Work still in the development stages includes extraction of methane gas from coal seams south of Sydney and the investigation of potential bulk natural gas storage facilities adjacent to the main population centres.

## Victoria

### State Electricity Commission—SEC

The SEC is Australia's largest electricity supply authority and individual coal producer. It is a semi-government authority with the principal responsibility of generating or purchasing electricity for supply throughout Victoria. It may own, develop and operate brown coal open cuts and briquetting plants and develop the States's hydro-electric resources. It is required to meet, from its own revenue, all expenditure involved with operating its power and fuel undertakings and to provide for statutory transfers to the consolidated revenue of the State. In 1985-86 its revenue was \$1,779 million. At 30 June 1986 it had total fixed assets of \$8,607 million and a staff of 22,045.

The SEC was established by an Act of the Victorian Parliament in 1921 and now operates under the *State Electricity Commission Act 1958*. Since it began operating, the SEC has expanded and co-ordinated the generation, purchase and supply of electricity on a State-wide basis to the stage where its system provides almost all the electricity produced in Victoria and its transmission covers almost the entire population of the State. At 30 June 1986 it distributed electricity directly to 1,457,000 customers and indirectly to a further 279,300 through 11 metropolitan councils which buy power in bulk for retail distribution under franchises granted by the Victorian Government before the SEC's establishment.

### Existing electricity system

The SEC Act requires the SEC to apply the natural resources of the State. Of the State's recoverable fossil fuel reserves, brown coal represents 94.6 per cent, natural gas 2.6 and oil 2.8. The SEC therefore has committed itself to increasing the proportion of total Victorian requirements met with coal based energy.

Victoria's electricity system is based upon the State's extensive brown coal resource in the Latrobe Valley, 140 to 180 km east of Melbourne in central Gippsland. It is one of the largest single brown coal deposits in the world, amounting to 200,000 megatonnes, of which 52,000 are economically winnable.

The coal is young and soft with a moisture content of 60 to 70 per cent and occurs in thick seams located from relatively close to the surface to a depth of several hundred metres. The coal can be won continuously in large quantities and at low cost by a specialised mechanical plant. The SEC's coal-fired power stations have been established near the coal deposits because the coal's high moisture content would make the coal expensive to transport.

The major brown coal-fired generating plants in the system are the 2,000 MW Loy Yang 'A', the 1,600 MW Hazelwood and 1,450 MW Yallourn 'W' power stations. Other brown coal-fired plants are Morwell (170 MW) and Yallourn 'E' (240 MW). These stations are all located in the Latrobe Valley and generate 80 per cent of the State's electricity requirement.

Other thermal stations are Jeeralang (465 MW) gas turbine station in the Latrobe Valley and Newport 'D' (500 MW) gas-fired station in Melbourne. There are hydro-electric power stations in north-eastern Victoria: Kiewa (184 MW), Dartmouth (150 MW) and Eildon/Rubicon/Cairn Curran (135 MW). Victoria is also entitled to about 30 per cent of the output of the Snowy Mountains Hydro-Electric Scheme and half of the output of the Hume hydro-electric station near Albury.

The SEC's total installed generating plant capacity at 30 June 1986 was 7,003 MW, including both capacity within the State and that available to it from New South Wales. In 1985-86 electricity generated by the SEC in its thermal and hydro-electric power stations, or purchased, totalled 28,151 GWh.

#### **Power station construction**

Construction of the Loy Yang 'A' power station complex south-east of Traralgon in the Latrobe Valley was authorised by the Victorian Government in 1976. It is the largest single engineering project undertaken in Australia. Coal-fired, Loy Yang will provide base load electricity for the Victorian grid and almost double the State's generating capacity. The project nominally comprises two 2,000 MW power stations, Loy Yang 'A' and Loy Yang 'B', in eight 500 MW units.

#### **Transmission and distribution**

The Victorian electricity distribution system has been completed, except for some isolated and remote areas of the State. Main transmission is by 500, 330, 220 and 66 kV lines which supply the principal distribution centres and interconnection between generating sources.

Three 500 kV transmission lines and six 220 kV lines link the Latrobe Valley stations with Melbourne and the State grid while three 330 kV lines provide the interstate link, two through the Snowy scheme. Bulk distribution of power throughout the main regional areas is by 220 kV lines to terminal stations which reduce the voltage to 66 kV or 22 kV for delivery to zone substations for further distribution. Feeder lines then deliver to distribution substations which in turn reduce the voltage to 415/240 volts for reticulation to individual customers. Some big industrial concerns take power at higher voltages.

The main transmission grid is currently being augmented to provide for increased power from the Latrobe Valley and to meet load growth in north-eastern and western areas of the State and the Mornington Peninsula.

#### **Gas reticulation**

The Gas and Fuel Corporation of Victoria is the largest gas undertaking in Australia, the sole reticulator of gas in Victoria, and a major marketer of liquefied petroleum gas (LPG). Constituted on 6 December 1950, it was formed by merging the interests of the privately-owned Metropolitan and Brighton Gas Companies with the State Government. (Through its predecessor, the Metropolitan, the Corporation is descended from the first gas company in Victoria—The City of Melbourne Gas and Coke Company founded in 1850 and incorporated in 1853.)

The merger gave the newly-formed Corporation an unusual status—that of a public authority owned jointly by the State and private shareholders. With its expanded capital structure, the Corporation was able to build a plant at Morwell to gasify indigenous brown coal, with the objective of improving Victoria's gas supply. Commissioned in 1956, the Lurgi high pressure brown coal gasification works supplemented metropolitan gas production until the introduction of natural gas in 1969.

Commercial reserves of natural gas were discovered in the offshore Gippsland Basin in 1965 by Esso-BHP from which the Corporation purchases, under agreement, the State's natural gas requirements.

Supply is drawn from the Marlin, Barracouta, and Snapper fields in Bass Strait, and transported by pipeline to an onshore treatment plant at Longford, near Sale. Before it enters the Corporation's transmission system, an odorant is added to give the gas a distinctive smell, for safety reasons.

The Corporation reticulates gas, 99 per cent of which is natural gas, through a 20,000 kilometre network of underground transmission pipelines and mains to more than one million industrial, commercial, and domestic consumers.

## **Queensland**

### **Organisation**

The electricity supply industry in Queensland operates under a two-tier structure consisting of the Queensland Electricity Commission and seven electricity boards. The Queensland Electricity Commission, under the terms of the *Electricity Act 1976-1986* is responsible for the co-ordination and regulation of the electricity supply industry in Queensland.

The Commission has direct responsibility for electrical safety, loan raising, fixing tariffs and planning the electricity system as well as for construction and operation of major power stations and the main transmission system. It provides electricity to the seven electricity boards and certain special major users of power.

#### **Electricity generation, transmission and distribution**

During 1986-87, nearly 97.8 per cent of the State's generation of 21,133 GWh was produced by coal fuelled steam power stations. Two hydro-electric stations in the north of the State provided 2 per cent, while the balance was produced by internal combustion plant located in towns remote from the interconnected grid and by gas turbine plant at several locations. Wivenhoe pumped storage generating station produced 554 GWh at times of peak system load while using 767 GWh for pumping purposes. A further 184.7 GWh was purchased from private producers of electricity for re-distribution to customers within the State-wide interconnected system.

At 30 June 1987, the total generating capacity in the State was 5,126 megawatts (MW), comprising 4,256 MW of coal-fired steam plant, 632 MW of hydro-electric plant, 178 MW of gas turbine plant and 60 MW of internal combustion plant. For the foreseeable future, coal-fired power stations will provide the bulk of the State's electrical energy requirements, augmented by pumped storage and conventional hydro-electric stations for peaking capacity.

At the end of June 1987 the transmission and distribution system within the State comprised 156,663 circuit kilometres of electric lines providing electricity to 1,039,753 customers. The main transmission voltages are 275, 132, 110 and 66 kV. The single wire earth return (SWER) system is used extensively in rural electrification and 49,642 kilometres of this line was in service at 30 June 1987.

#### **New development**

The completion of Tarong Power Station in November 1986 brought into operation a generating capacity of 1,400 MW. There are two generating stations presently under construction that will provide an additional 2,100 MW of generating capacity for the State network.

The Callide 'B' power station, located in the central region of the State, near Biloela, will consist of two generating sets each of 350 MW capacity. The station was 85 per cent complete by the end of 1986-87.

Work on the Stanwell power station, near Rockhampton, is proceeding to a schedule proposing first generation in 1993. This station will comprise four sets each rated at 350 MW capacity.

#### **Gas reticulation**

Queensland has a reticulated gas system in the Brisbane region and in the cities and towns of Bundaberg, Cairns, Toowoomba and Dalby. By June 1986 there were over 2,908 kilometres of mains laid in these centres and the systems serviced 154,047 consumers. South Brisbane, Toowoomba and Dalby reticulate natural gas, whereas North Brisbane, Bundaberg and Cairns reticulate reformed town gas. Total sales of natural gas in 1985-86 were 17,325 TJ compared with 17,542 TJ in 1984-85. Sales of reformed town gas were 1,053 TJ and 1,062 TJ respectively.

### **Western Australia**

#### **State Energy Commission of Western Australia**

On 1 July 1975 the Government of Western Australia combined the State Electricity Commission and the Fuel and Power Commission to form a new organisation known as the State Energy Commission of Western Australia. The Commission is specifically responsible for ensuring the effective and efficient utilisation of the State's energy resources and for providing economical and reliable supplies of electricity and gas.

#### **Electricity generation and distribution**

The Commission owns and operates three major thermal power stations. These are located at Muja, (1,040 MW capacity) and Bunbury (120 MW), both using local coal to produce electricity, and at Kwinana (900 MW). Kwinana power station has the capacity to burn coal, oil or natural gas, although natural gas (from the North West Shelf) is the major fuel used. A small (2 MW) hydro-electric station is situated at Wellington Dam near Collie, and there are 20 MW capacity gas turbine generating units at Geraldton, Kalgoorlie and Kwinana.

Two power grid systems operate in Western Australia and supply the electricity needs of 98 per cent of the State's population. The two systems are:

- *The South West interconnected system.* Power from the three major stations is fed to the South West system. This grid services the metropolitan area and the South West and Great Southern areas, including an area extending eastwards to Kalgoorlie and northwards as far as Kalbarri, some 100 km north of Geraldton. Kalgoorlie was brought into the South West grid system in 1984 following construction of a 680 km transmission line from Muja, one of the longest radial feed lines constructed in Australia.
- *The Pilbara interconnected system.* This system was established during 1985-86 and interconnects Karratha, Cape Lambert and Port Hedland. Electricity is supplied from generating plant at Cliffs Robe River Iron Associate's power station at Cape Lambert. The plant is fuelled by North West Shelf natural gas. When necessary, additional power can be drawn from the Commission's stand-by diesel power generating facility at Port Hedland or from Hamersley Iron Pty Ltd's power station at Dampier.

In areas too remote to utilise the interconnected grid systems, the Commission operates 29 diesel power stations. The Commission owns and operates 8 of these stations while the remaining stations are owned by local authorities but operated by the Commission under the Country Town's Assistance Scheme (CTAS). Under this scheme, the Commission operates the electricity undertakings but ownership remains with the shires which are required to raise the funds needed for capital works, including generating plant, distribution extensions and upgrading.

At 30 June 1986, the Commission's generating capacity from its interconnected grid system was 2,177 MW, while the capacity of its supply system in country areas was 162 MW. There were 536,254 customer accounts for electricity throughout the State.

The Commission is also responsible for the design, construction and maintenance of power stations at isolated Aboriginal communities in the Pilbara, Kimberley, Central Aboriginal Reserve and Eastern Goldfields. At 30 June 1986, there were 38 such village power stations funded by the Commonwealth Government.

### **Gas reticulation**

The Commission is the main supplier of gas in Western Australia. It operates an extensive North West Shelf natural gas reticulation system in the Perth metropolitan area as well as smaller country reticulation systems at Geraldton to the north and Pinjarra and Bunbury in the south-west. The Commission also reticulates tempered liquefied petroleum (TLP) gas through a local system at Albany on the south coast.

At 30 June 1986, there were 160,369 customer accounts for natural gas and 2,389 customer accounts for TLP gas.

## **South Australia**

### **Electricity Trust of South Australia**

In 1946 the assets of the Adelaide Electric Supply Co. Ltd were transferred to a newly-formed public authority, the Electricity Trust of South Australia, which became responsible for unification and co-ordination of the major portion of the State's electricity supply, taking over the powers previously vested in the South Australian Electricity Commission. In addition to the powers specified in the *Adelaide Electric Supply Company's Acts, 1897-1931*, the Trust may supply electricity direct to consumers within a district or municipality with the approval of the local authority; arrange, by agreement with other organisations which generate or supply electricity, to interconnect the mains of the Trust with those of other organisations; and give or receive supplies of electricity in bulk.

### **Capacity and production**

At 30 June 1987, the Electricity Trust's installed capacity was 2 680 MW. Its major power stations are Port Augusta Northern Power Station (500 MW), Torrens Island (1 280 MW) and Port Augusta Playford 'B' (240 MW). Of the older stations, Playford 'A' (90 MW) and most of Osborne (240 MW) have been placed on cold storage. The Trust also operates gas turbine stations at Dry Creek (156 MW), Mintaro (90MW) and Snuggery (75 MW) and a small diesel station at Port Lincoln (9 MW).

The Trust supplies approximately 630 000 customers, accounting for over 99 per cent of all electricity consumers in the State. Following the acquisition of seven district council

electricity undertakings on Eyre Peninsula during 1986–87, the Trust is now responsible for supplying only 900 customers indirectly through bulk supply. Approximately 3 000 additional customers are supplied by small independent electricity undertakings operating mainly diesel generating plant in remote areas of the State.

The two main fuels used by the Trust are coal from Leigh Creek for the Port Augusta power stations and natural gas from the Cooper Basin for the Torrens Island, Dry Creek and Mintaro stations.

#### **Future developments**

To meet future demands, a third 250 MW unit at the Northern Power Station, also fuelled by Leigh Creek coal, is scheduled for commissioning in 1993.

A 500 MW capacity interconnection with the Victorian-New South Wales systems, being constructed, is scheduled for commissioning in 1990.

#### **Gas reticulation**

The South Australian Gas Company (SAGASCO), a privately owned company regulated by State legislation, was incorporated by Act of Parliament in 1861. The first gas was produced at Brompton in 1863.

When natural gas became available from the Cooper Basin in the late 1960s, SAGASCO, in 1966, contracted a supply of this indigenous fuel. Deliveries commenced in 1969 and, with the complete conversion of the metropolitan area to natural gas in January 1971, coal carbonising and carburetted water gas plants were shut down.

Under the 1966 contract, SAGASCO paid the producers who, in turn, paid the transportation charge of the Natural Gas Pipelines Authority. In 1974, major changes to contracts and other arrangements were effected. The Pipelines Authority—renamed the Pipelines Authority of South Australia (PASA)—became responsible for purchasing gas at the Cooper Basin and on-selling to customers. The 1966 contract was shortened to expire on 1 January 1988, from which date a new supply contract with PASA takes effect.

Natural gas is reticulated through most of the Adelaide metropolitan area, Angaston and Port Pirie. Liquefied petroleum gas is distributed by reticulation at Mount Gambier and Whyalla, and is available elsewhere as bottled gas.

The conversion of the metropolitan distribution system to natural gas brought marked changes in the Company's operations. The Company is now concerned largely with the distribution and marketing of gas, rather than manufacturing. Great emphasis is placed on marketing gas to industry, where, as a cheap, non-polluting fuel, it is able to compete successfully with other fuels.

#### **Tasmania**

A considerable part of the water catchment in Tasmania is at high altitude. The establishment of numerous dams has created substantial artificial storage which has enabled the State to produce energy at a lower cost than elsewhere in Australia and in most other countries. Another factor contributing to the low cost is that rainfall is distributed fairly evenly throughout the year with comparatively small yearly variations. Abundant and comparatively cheap supplies of electricity played an important role in attracting industry to Tasmania.

#### **Hydro-Electric Commission**

The Commission was created in 1930, taking over the activities of the Hydro-Electric Department and the existing small hydro-electric installations. Development initially concentrated on hydro-electric generation feeding into a State-wide power grid (King Island from 1951 and Flinders Island from 1968 are outside the grid and are supplied by diesel generators). During 1974, the construction of a substantial oil fired thermal station with a capacity of 240 MW was completed to supplement the continuing hydro development program.

#### **Installed capacity**

At 30 June 1987 the generating system had an installed capacity of 2 171 MW. The most recent completion, the Pieman River Power Development (231 MW), was officially opened on 1 May 1987.

Installation of a third 144 MW generator at the Gordon Power Station will bring the capacity at that site to 432 MW and is expected to be completed by March 1988.

Work began in 1982-83 on Stage 2 of the Gordon River Power Development but was halted when the Federal Government refused consent for the project to proceed. The Hydro-Electric Commission then began work (in August-September 1983) on two smaller hydro power schemes in Western Tasmania. These are the King River Power Development, scheduled for completion in mid-1991 and the Anthony Power Development, expected to be commissioned some 18 months later. They will add about 227 MW to the installed capacity of the system.

#### **Gas reticulation**

Gas is only a minor energy source in Tasmania. Town gas is manufactured and reticulated only in Launceston. Bottled LPG is a minor domestic, commercial and motor fuel in the State.

#### **Northern Territory**

The Power and Water Authority is a Statutory Authority, created on 1 July 1987, with responsibility for the sale of natural gas, electricity generation, distribution, transmission and sale, and water and sewerage services.

In Darwin, the major electricity source is the gas-fired Channel Island Power Station completed in October 1987 with a capacity of 186 MW. In Alice Springs, power is generated at the Ron Goodwin Power Station which operates on natural gas. In Katherine, electricity is generated at the Katherine Power Station, completed in September 1987. Natural gas is also used as a fuel for electricity generation at the Tennant Creek Power Station.

A natural gas pipeline from the Amadeus Basin in Central Australia to Darwin was completed in December 1986, enabling electricity generation in Darwin, Katherine and Tennant Creek to use an indigenous fuel to replace expensive, imported fuel. The Alice Springs Power Station is fuelled by natural gas from Palm Valley via a separate pipeline.

Many small communities in the Territory generate their own power using diesel-fired generating sets and responsibility for these operations has been transferred to the Power and Water Authority.

#### **Australian Capital Territory**

##### **Electricity distribution**

The supply authority is the A.C.T. Electricity Authority within the Territory. Supply was first made available in Canberra during 1915 and was met from a local steam plant. Connection to the New South Wales interconnected system was effected in 1929. The Authority's electricity supply requirements are met by a Snowy Mountains reservation of 670 GWh and the balance is provided by the Electricity Commission of New South Wales. The locally-owned plant consists of 3 MW diesel alternators which are retained as a standby for essential supplies. The total number of ultimate consumers at 30 June 1987 was 98,201. During the year 1986-87 the bulk electricity purchased was 1,963 GWh and the system maximum demand was 546 MW.

##### **Gas reticulation**

Reticulated gas first became available in the Australian Capital Territory in January 1982. Natural gas from the Moomba fields in South Australia is piped to Canberra via a 60 km spur which branches from the main Moomba-Sydney pipeline at Dalton. AGL Canberra Ltd has invested capital of \$45 million to set up the infrastructure necessary to service and support a major utility and, to date, has laid over 1,600 kilometres of gas mains, bringing reticulated natural gas within reach of an estimated 46,500 dwellings in 50 suburbs.

During 1986-87, AGL Canberra Ltd reticulated 2,597 terajoules of natural gas to 570 commercial and industrial establishments and about 12,000 homes. Over the next five years the company expects to invest a further \$55 million and, in the long term, over 2,500 kilometres of gas mains will service over 50,000 customers in the Territory.

#### **National survey of household energy usage**

About 27 per cent of all reticulated electricity and 13 per cent of reticulated gas is consumed by households. To facilitate planning by energy authorities to meet this demand, the Austra-

lian Bureau of Statistics conducted a national survey of energy usage by household in private dwellings. The survey sought information on:

- what facilities and major appliances were held by the household at the time of interview;
- the quantity and cost of reticulated gas and electricity consumed by the household over a twelve month period prior to interview;
- the usage patterns for major appliances and reticulated energy consumption recorded in a special diary over a seven day period after the interview.

To determine the significance of seasonal usage patterns, interviews were conducted progressively over the period June 1985 to June 1986 with the sample of over 19,000 households being spread both geographically and temporally to provide, for any State/area, a series of observations over the year.

**RETICULATED ENERGY: AVERAGE ANNUAL CONSUMPTION AND EXPENDITURE BY HOUSEHOLD COMPOSITION BY STATE/TERRITORY AND CAPITAL CITIES, 1985-86.**

**Other Publications**

Other organisations which produce statistics in this field include the Department of Primary Industries and Energy, the Joint Coal Board, the Australian Institute of Petroleum, the Electricity Supply Association of Australia and the Bureau of Mineral Resources, Geology and Geophysics. State government departments and instrumentalities also are important sources of energy data, particularly at the regional level, while a number of private corporations and other entities operating within the energy field also publish or make available a significant amount of energy information.

# MANUFACTURING AND INTERNAL TRADE

---

## MANUFACTURING

An historical summary of the development of the manufacturing industry in Australia since 1788 is contained at the end of the chapter.

### Government authorities

#### Industries Assistance Commission

The Industries Assistance Commission (IAC) is a statutory authority which came into existence on 1 January 1974 as a result of the passing of the *Industries Assistance Commission Act 1973* by the Commonwealth Parliament. The Commission replaced the Tariff Board which, since 1921, had been responsible for advising the government on assistance for industries mainly in the manufacturing sector of the economy.

The Commission is an advisory authority. The government is required to seek the Commission's advice before it makes changes in the assistance afforded industries, but the government is not obliged to accept the Commission's advice.

In August 1983, the Government initiated a review of the functions and operations of the Commission. Decisions taken on the recommendations of that review, and reflected in the *Industries Assistance Commission Amendment Act 1984*, were designed to improve the Commission's operations and procedures so that it could more effectively assist the government to meet its industry policy objectives.

The Commission's basic functions remain unchanged. These are to hold inquiries, conduct public hearings and to make reports to the government on assistance, and matters associated with assistance, to industries in the rural, mining, manufacturing and services sectors of the economy. Inquiries are initiated by references from the Minister administering the *Industries Assistance Commission Act 1973*. The Commission is also required to report annually to the government on its operations and on the general structure of industry assistance within Australia and its effects on the economy.

The Commission operates under general policy guidelines which are cast in terms of encouraging the growth of efficient and internationally competitive industries, facilitating structural adjustment and recognising the interests of other industries and consumers.

The Commission is required to give wide public notice that it is conducting an inquiry. Typically, the Commission prepares a draft report on the basis of consultation with interested parties, written submissions and the Commission's own investigatory work. Draft reports are published and public hearings are held to give interested parties an opportunity to examine and comment before Commission reports are finally settled. Public hearings are conducted in an informal manner and may be held in Canberra or other cities throughout Australia.

It is the government's intention that, in most cases, final Commission reports will be published prior to a government decision being taken. When released for publication, these Commission reports are sold by Commonwealth Government Bookshops.

If after receiving a report from the Commission, the government decides that assistance afforded a particular industry should be changed, it introduces a proposal to this effect in Parliament. Thus, the final responsibility for altering assistance given to particular industries within Australia rests with Parliament.

#### Bureau of Industry Economics

The Bureau of Industry Economics has been established by the Australian Government as a centre for research into the manufacturing and commerce sectors. Formally attached to

the Department of Industry, Technology and Commerce, it has professional independence in the conduct and reporting of its research.

The major objectives of the Bureau are to:

- carry out research work needed to assist the government in the formation of industrial policy;
- assist the Industries Assistance Commission and other government bodies by making submissions on the results of its research;
- attract a high standard of professional staff and publish its research findings;
- complement the work of other research agencies and co-operate with universities and colleges in developing research programs.

Activities coming within the Bureau's research area include manufacturing, wholesale and retail trade and personal and business services. These currently contribute well over 50 per cent of gross domestic product in Australia and absorb an even larger share of the labour force.

The Bureau is also concerned with developments in mining, rural industry, public and private services and international trade and investment where these impinge on the manufacturing and commerce sectors.

A Council of Advice advises the Minister of Industry, Technology and Commerce about the Bureau's work and ensures that it is relevant to contemporary and long-term issues in manufacturing and commerce. Its members are drawn from a wide range of industries and backgrounds, including the universities and the trade union movement. The Council assists with the work of the Bureau and the effective dissemination of the results of the Bureau's work.

As well as conducting longer-term research, the Bureau provides the Minister for Industry, Technology and Commerce with regular briefings on economic trends. It also undertakes short-term projects of immediate relevance. The techniques of economic analysis used include supply and demand estimation, industry structure-performance relationships, input-output analysis, econometrics, cost-benefit methods and socio-demographic investigations. Technical and social factors affecting industry structure and performance are also taken into account in investigations.

The staff of the Bureau consists of approximately 70 officers with backgrounds in business, government and university teaching and research.

Research projects often require special surveys where existing data sources are inadequate or more detailed information is required for particular industries. In certain projects, the Bureau undertakes joint research with other organisations and consultants are engaged when this will significantly enhance the quality of the research.

Current research projects include:

- investment;
- depreciation case studies;
- economies of scale;
- industrial development policies;
- evaluation of government programs;
- globalisation (growth in international industrial interdependence);
- trade in services;
- regulation case studies;
- technology transfer and diffusion.

Ongoing research areas include:

- small business;
- corporate taxation;
- economic conditions.

The results of the Bureau's research are published in working papers, which generally address technical issues or present preliminary results and information bulletins which contain statistics and other information and research reports which give comprehensive results of the Bureau's major projects.

## Standardisation

### The Commonwealth Scientific and Industrial Research Organisation—CSIRO

CSIRO is obliged by two Acts of Parliament to be associated with national standards. The functions of CSIRO as laid down by these Acts involve establishing, developing and maintaining standards of measurement of physical quantities and to promote the use of these standards.

CSIRO first undertook this role in 1938 after government acceptance of a recommendation by a Secondary Industries Testing and Research Committee that these functions were essential for the successful development of manufacturing industry in Australia. Since that time, standards and calibrations have been established for a very wide range of physical quantities, extending considerably beyond the minimum required by law. From 1978, CSIRO has been responsible for first level calibrations in the defence area.

In certain specialist areas, CSIRO has authorised other bodies to carry out functions related to standards. CSIRO has authorised the Australian Nuclear Science and Technology Organisation (Department of Primary Industries and Energy) and the Australian Radiation Laboratory (Department of Community Services and Health) to maintain standards for quantities relating to ionising radiations, such as radioactivity, exposure, and absorbed dose. It has also authorised the Division of National Mapping (Department of Administrative Services) to maintain working standards and co-ordinated universal time and the Australian Telecommunications Commission (Department of Transport and Communications) to maintain working standards of frequency.

At the international level, a treaty now widely known as the Metric Treaty has been signed by 45 member nations, including Australia. The International Bureau of Weights and Measures (BIPM) co-ordinates activities under the Treaty by providing a mechanism for making international agreements in scientific metrology and for co-ordinating research on basic scientific problems in measurement. CSIRO has representatives on five of the BIPM's consultative committees, while the Australian Radiation Laboratory and the Australian Nuclear Science and Technology Organisation (as CSIRO agents) are represented on another consultative committee. Statements recognising the equivalence of many of the Australian primary standards with those of the United States, the United Kingdom and Canada have been exchanged.

### The Standards Association of Australia

The Standards Association of Australia is the organisation responsible for the preparation, on a national basis, of Australian standards for materials and products and standard codes of practice.

Formed as the Australian Commonwealth Engineering Standards Association in 1922, it was reconstituted as the Standards Association of Australia in 1929, and was incorporated by Royal Charter in 1950. It is an independent body, having the full recognition and support of the Commonwealth and State Governments and of industry. Approximately one-third of its funds are provided by Commonwealth Government grant, the remainder coming primarily from membership subscriptions and from the sale of publications. Organisations, companies, and individuals are eligible for subscribing membership.

The Association is controlled by a council comprising representatives from Commonwealth and State Governments and their departments, from associations of manufacturing and commercial interests, and from professional institutions. Standards are prepared by committees composed of expert representatives from the interests associated with the subject under consideration. This assistance is on a voluntary basis.

Preparation of a standard is undertaken in response to a request from any responsible source, subject to verification that the standard will meet a genuine need. Standards may relate to one or more of several aspects of industrial practice such as terminology, test methods, dimensions, specifications of performance and quality of products, and safety or design codes. In general, standards derive authority from voluntary adoption based on their intrinsic merit, but in many cases where safety of life or property or consumer protection is involved, they may have compulsory application through statutory reference.

The Association is the owner of a registered certification trademark covering conformity of products to standards. Manufacturers of products covered by Australian standards may obtain a licence to use the StandardsMark, under conditions established by the Association. It also operates a Supplier Assessment Scheme which attests to the adequacy of manufacturers' quality systems to national and international standards.

The Association has international affiliations and is a member, representing Australia, of the International Organization for Standardization (ISO) and of the International Electrotechnical Commission (IEC). Close links are maintained with overseas standards organisations, and the Association acts as Australian agent for the procurement of ISO and IEC publications and the standards of other countries.

The Association has two specialised information centres, one in Sydney and one in Melbourne, containing the national standards of all countries with standards organisations. These centres provide a necessary information service to those concerned with standards development and for researchers from all sectors of the community.

The headquarters of the Association is in Sydney, and there is a major office in Melbourne. Offices are also located in other capital cities and Newcastle.

### **The National Standards Commission**

The Commission was established in 1948 and is presently located at North Ryde, Sydney. The Commission operates under the National Measurement Act and its principal objectives are to promote and co-ordinate the use in Australia of a uniform system of units and standards of measurement of physical quantities and to bring about the progressive introduction of the metric system as the sole system of measurement of these quantities. The Commission also examines and approves the patterns of measuring instruments used for trade, in order to control design and quality.

The Commission has close contact with all State and Territorial Weights and Measures Authorities and provides assistance in the accreditation and training of weights and measures inspectors. The Commission is currently chairing a working party developing Uniform Trade Measurement Legislation for Australia.

Close liaison is also maintained with the manufacturing industry, retailers, consumers and other users to ensure a balance between design, quality, cost and consumer protection.

The Commission has regular contacts overseas, provides the Australian member accredited to the International Organisation of Legal Metrology and provides training courses for countries in the Asia-Pacific region. The Commission is directed by a board of seven part-time Commissioners.

### **The National Association of Testing Authorities—NATA**

NATA organises testing facilities throughout Australia to serve private and governmental needs. Membership is open to authorities whose testing laboratories conform to the standards of staffing and operations defined by the Association. Testing authorities may register their laboratories voluntarily. The Association assesses the competence of the laboratories and ensures that their standards of competence are maintained. Certificates of test issued by registered laboratories may be endorsed in the name of the Association. NATA-endorsed test certificates are generally accepted by governmental, industrial and commercial interests.

Laboratories are registered for performance of specific tests in the fields of acoustic and vibration measurement, biological testing, chemical testing, electrical testing, heat and temperature measurement, mechanical testing, medical testing, metrology, non-destructive testing and optics and radiometry.

### **The Industrial Design Council of Australia—IDCA**

IDCA is a non profit-making design information body, offering assistance to manufacturers developing and launching new products in Australia.

The Council is representative of industry and commerce, together with designers and educationalists. In 1987-88 about 9 per cent of its funds will come from State government grants and the balance will be from fees for services to industry (75%) and Federal Government contracts (6%).

The Council's services include the Product Assessment Scheme (PASS scheme), technical

and market feasibility evaluation of new products, design counselling, product development management and training programs for manufacturing management (Star Product Programs). The Council also administers the Australian Design Awards program for high quality products of Australian design and manufacture.

The Council has a membership scheme for information exchange and specialist referral services that include senior level manufacturers' designers, marketing and advertising executives, material suppliers and design students.

The Council's programs and activities are designed to promote easy access to, and collaboration between, Australia's service and manufacturing communities to help achieve international competitiveness through improvement of price and non-price factors in locally developed products. The Council has a professional staff comprising engineers, ergonomists and marketing consultants located in offices in Perth, Adelaide, Sydney and Brisbane. Its national office is located in Melbourne.

### **The Australian Standard Commodity Classification—ASCC**

ASCC has been developed by the ABS to enable users to compare statistics of commodities produced in Australia with statistics of commodities imported and exported.

The ASCC manual (1207.0 and 1208.0) links production, import and export items at their most detailed level of comparability in the form of standard (ASCC) commodity items. In a large number of cases, however, due to the differences between production, import and export items, comparability is only achieved at fairly broad aggregate levels. In ASCC, commodities are grouped under industries (as defined in the Australian Standard Industrial Classification) in which they are typically produced.

The latest edition published is in respect of the year 1984–85. The classification will continue to be developed over the coming years to improve the alignment between production, imports and exports.

### **The Australian Standard Industrial Classification—ASIC**

ASIC (1201.0 and 1202.0) was developed by the ABS as part of its program for the integration of economic statistics. Since its introduction in the processing of the 1969 Integrated Economic Censuses, ASIC has gained a wide acceptance by users of statistics outside the ABS and has been progressively applied in most ABS collections and compilations where data are classified by industry.

ASIC has been devised for the purpose of classifying statistical units by industry. It has been designed primarily as a system for the classification of establishments (e.g. individual mines, factories, shops, etc.) although it may also be used for classifying other economic units such as enterprises.

The fundamental concept of this classification system is that an industry (i.e. an individual class, group, etc.) in ASIC is composed of establishments that have been classified to it. Each industry class is defined in terms of the predominant activities of the establishment classified to it and these activities are specified in ASIC as *primary activities* of the individual industry classes. These industry definitions are revised only at relatively infrequent intervals so as to minimise the disruption to time series data assembled on an ASIC basis.

To date, ASIC has been revised twice. ASIC editions published hitherto are: 1969 (original), 1978 (first revision) and 1983 (second revision)—the latter (the 1983 edition) is the one currently in use.

## **Manufacturing industry statistics**

### **Manufacturing industry statistics from 1901 to 1967–68**

A series of substantially uniform statistics exist from 1901 up until 1967–68 when the framework within which manufacturing statistics were collected was changed. Detailed manufacturing statistics in respect of this period are included in *Year Book* No. 57, pages 721–9, and in earlier issues.

### **Manufacturing industry statistics from 1968–69**

As from the year ended June 1969, the Censuses of Manufacturing, Electricity and Gas have been conducted within the framework of the Integrated Economic Censuses which

include the Censuses of Mining, Retail Trade, Wholesale Trade, Construction and Electricity and Gas industries. As a result, manufacturing industry statistics for 1968-69 and subsequent years are not directly comparable with previous years.

The standardisation of census units in the integration of economic censuses means that the basic census unit (the establishment), in general, covers all the operations carried on under the one ownership at a single physical location. The manufacturing establishment is thus one predominantly engaged in manufacturing, but the data supplied for it cover (with a few exceptions) all activities at the location. The establishment statistics also include data relating to separately located administrative offices and ancillary units serving the establishment and forming part of the business (enterprise) which owns and operates the establishment.

Census units are classified to industry as described in the ABS publication *Australian Standard Industrial Classification* (1201.0 and 1202.0). ASIC defines the industries in the economy for statistical purposes, thus permitting the scope of the different economic censuses to be specified without gaps or overlapping between them. It also sets out standard rules for identifying the statistical units (e.g. establishments) and for coding them to the industries of the classification. This classification is broadly convertible to the International Standard Industrial Classification adopted by the United Nations Statistical Commission. The adoption of ASIC has resulted in changes in scope between the integrated economic censuses introduced in 1968-69 and the individual economic censuses conducted in previous years.

In the 1967-68 Census there were approximately 62,600 manufacturing establishments (excluding electricity and gas establishments) with employment of 1,276,000. Of these, approximately 35,400, with employment of 1,097,000 would have been included in the 1967-68 Census if ASIC had been used.

#### MANUFACTURING ESTABLISHMENTS: SUMMARY OF OPERATIONS, AUSTRALIA

| Census year      | Establishments at 30 June | Average employment over whole year (a) |         |           | Wages and salaries (b) | Turnover                                                       | Stocks   |          | Purchases, transfers in and selected expenses |            | Fixed capital expenditure less disposals |  |
|------------------|---------------------------|----------------------------------------|---------|-----------|------------------------|----------------------------------------------------------------|----------|----------|-----------------------------------------------|------------|------------------------------------------|--|
|                  |                           | Males                                  | Females | Persons   |                        |                                                                | Opening  | Closing  | Value added                                   | Value less |                                          |  |

(a) Includes working proprietors. (b) Excludes the drawings of working proprietors. (c) These data and that of previous years include the data of all manufacturing establishments. (d) These data and those of following years exclude single establishment manufacturing enterprises with fewer than four persons employed. (e) These data and those of previous years are classified to the 1969 (preliminary) edition of ASIC. (f) These data and those up to and including 1982-83 are classified to the 1978 edition of ASIC. (g) These data and those of following years are classified to the 1983 edition of ASIC.

The items of data on the census forms were standardised for all census sectors, which has meant changes in the content of the statistics. For example, the value of 'turnover' is now collected instead of the 'value of output' at the factory, and purchases and selected expenses are collected as well as the value of specified materials, fuels, etc., used. However the underlying concept of 'value added' is similar to the former concept 'value of production', even though its method of derivation is different.

Even though the concept of 'value added' is similar to 'value of production', direct comparison of 1968-69 and previous figures is not possible because of the change in census units already mentioned which has resulted in the 'value added' for the whole establishment being reported, not merely the 'value added' for the manufacturing process. Comparison is also affected, of course, by the change in the scope of the Manufacturing Census due to the adoption of ASIC. In addition, 'value added' as calculated for the Manufacturing Census differs from the concept used in the National Accounts where the concept of 'value added' also excludes some administrative expenses and sundry charges and the change in stocks component is measured by valuing the physical change in stocks at current prices. It is not practicable in the Manufacturing Census to collect data fully in accord with the National Accounts concept of 'value added'.

For a more detailed description of the Integrated Economic Censuses reference should be made to *Year Book* No. 56, Chapter 31.

Since the introduction of the system of Integrated Economic Censuses the comparability of Manufacturing Census data has been affected by three additional changes to collection practices:

- (i) Commencing with the 1975-76 Manufacturing Census, only a limited range of data (i.e. employment and wages and salaries) are collected from single establishment manufacturing enterprises with fewer than four persons employed. This procedure significantly reduces both the statistical reporting obligations of small businesses and the collecting and processing costs of the Australian Bureau of Statistics without affecting the reliability of information for the evaluation of trends in the manufacturing sector of the economy (as these small enterprises contribute only marginally to statistical aggregates). In order to provide a link with past and future years, 1974-75 data were processed on both bases.
- (ii) Commencing with the 1977-78 Census the classification of census units to industry is based on the 1978 edition of ASIC which replaces the 1969 preliminary edition in use since the 1968-69 Census. In general the impact of the change in industrial classification is minimal at ASIC Division and Subdivision levels.
- (iii) From 1983-84, the classification of census units to industry is based on the 1983 edition of ASIC. The only changes to manufacturing resulting from use of the revised version of ASIC relate to establishments mainly engaged in minor repairs to aircraft or railway or tramway rolling stock. Previously, these establishments were excluded from manufacturing but are now included in industry subdivision 32—Transport Equipment.

### **Multi-establishment enterprises and single establishment manufacturing enterprises with four or more persons employed**

Main structural aggregates relating to number of establishments, employment, wages and salaries, turnover, purchases, transfers in and selected expenses, stocks, and value added are shown in the following tables. Further detailed statistics are contained in the following ABS statistical publications: *Manufacturing Establishments, Details of Operations by Industry Class, Australia* (8203.0), *Manufacturing Establishments, Summary of Operations by Industry Class, Australia* (8202.0) and *Manufacturing Establishments: Selected Items of Data Classified by Industry and Employment Size, Australia* (8204.0).

#### **Employment**

The statistics on the number of persons employed shown in the following table relate to the average whole year employment, including working proprietors and those persons working at separately located administrative offices and ancillary units in the State.

It should be noted that persons employed in each State (and their wages and salaries) relate to those employed at establishments, administrative offices or ancillary units located in that State, even though the administrative offices or ancillary units may have served establishments located in another State.

**MANUFACTURING ESTABLISHMENTS—MALES, FEMALES AND PERSONS  
EMPLOYED BY INDUSTRY SUB-DIVISION, 1984-85 AND TOTAL MANUFACTURING,  
1982-83 TO 1984-85**

### Turnover

The following table shows the value of turnover of manufacturing establishments. The figures include sales of goods whether produced by the establishment or not, transfers out of goods to other establishments of the same enterprise; bounties and subsidies on production; plus all other operating revenue from outside the enterprise (such as commission, repair and service revenue and rent, leasing and hiring revenue), plus capital work done for own use, or for rental or lease. Receipts from interest, royalties, dividends, and the sale of fixed tangible assets are excluded.

### Purchases, transfers in and selected expenses

The following table gives details of the value of purchases, transfers in and selected expenses. Figures include purchases of materials, fuels, power, containers, etc. and goods for resale, plus transfers in of goods from other establishments of the enterprise, plus charges for commission and sub-contract work, repair and maintenance expenses, outward freight and cartage, motor vehicle running expenses, sales commission payments and rent, leasing and hiring expenses.

## Value added

The statistics on 'value added' contained in the following table have been calculated by adding to the value of turnover the increase (or deducting the decrease) in the value of stocks, and deducting the value of purchases, transfers in and selected expenses.

### MANUFACTURING ESTABLISHMENTS—VALUE ADDED, BY INDUSTRY SUB-DIVISION, 1984-85 AND TOTAL MANUFACTURING, 1982-83 TO 1984-85 (\$ million)

(a) Includes working proprietors.

(b) Excludes the drawings of working proprietors.

### Principal manufacturing commodities

The factory production of certain commodities is shown in the monthly publications of the ABS, and in the annual publication, *Manufacturing Commodities, Selected Principal Articles Produced, Australia (Preliminary)* (8365.0). A more comprehensive list of articles produced is contained in the annual publication, *Manufacturing Commodities, Principal Articles Produced, Australia* (8303.0).

The table following shows the total recorded production of some selected articles manufactured in Australia. A more complete list is published in the ABS publication 8303.0 mentioned above.

(a) Business or formal. (b) Excludes powdered shampoo. (c) Includes wall ovens but excludes cooking tops and portable units. (d) Excludes grill boilers. (e) Includes double and triple superphosphate and ammonium phosphate expressed in terms of single superphosphate i.e. 22% P<sub>2</sub>O<sub>5</sub> equivalent. (f) Includes swim shorts. Excludes infants' and babies' swimwear. (g) Towels or tea towels of cotton or terry fabrics. (h) Metal and plastic only. (i) Excludes chemical. (j) Excludes wool from the fellmongered, dead or waste wool. (k) Primary origin only includes small quantities of zinc dust.

## Enterprise statistics—Integrated Economic Censuses and Surveys

The Integrated Economic Censuses and Surveys conducted by the Australian Bureau of Statistics have, since 1977-78, included enterprises primarily engaged in Mining and Manufacturing annually, with Electricity and Gas Production and Distribution collected in 1977-78 and annually from 1979-80, while other economic sectors are approached on a rotating basis. Statistics in respect of enterprises have been published in *Integrated Economic Censuses and Surveys, Enterprise Statistics: Details by Industry Class, Australia* (8103.0).

Below is a brief summary of the Censuses' collection units and methodology and a summary table of enterprise statistics. More detailed explanations on the Censuses are shown in the above publication.

The business units, as standardised for purposes of the Integrated Economic Censuses and Surveys are at three levels: the establishment (and associated administrative offices and ancillary units); the enterprise; and the enterprise group.

The central unit from which statistical information was collected is the *enterprise*, defined broadly as the unit comprising all operations in Australia of a single operating legal entity. The term legal entity is used to cover a sole proprietor, or partnership, or company, but also includes co-operative societies and some government authorities mainly engaged in the industries included in the Censuses and Surveys.

The group of legal entities owned or controlled by a single company is recognised as a separate type of unit—the *enterprise group*. The basic unit for which most data were collected and tabulated is the *establishment*, defined in general as a unit comprising all the operations carried on by the one enterprise at a single physical location—such as an individual factory, shop or mine.

In the Integrated Economic Censuses and Surveys, information was collected using a common framework of reporting units (enterprises and establishments as defined above) and data concepts and in accordance with a standard industrial classification (the *Australian Standard Industrial Classification*, 1983 Edition). As a result the statistics for the industries covered by the Censuses and Surveys are provided with no overlapping or gaps in scope, so that aggregates for economic data such as value added, employment, wages and salaries, fixed capital expenditure and stocks are obtained on a consistent basis for all industries and business units covered by the Censuses and Surveys. A detailed description of the Integration of Economic Censuses is contained in Chapter 31, *Year Book* No. 56, 1970.

### ENTERPRISES—SUMMARY OF OPERATIONS BY INDUSTRY, AUSTRALIA

| Industry and year                      | Enterprises operating during year (a) | Persons employed at 30 June (b) | Wages and salaries (c) | Turnover (d) | Purchases and selected expenses (e) | Rent and leasing and hiring expenses (f) | Stocks (g) |          | Value added (h) | Fixed capital expenditure less disposals (i) |

(a) The number of enterprises in operation for all or any part of the year which were in the scope of the censuses and surveys. (b) Working proprietors and employees, including part-time and casual employees as at 30 June. (c) Wages and salaries paid during the year to employees of the enterprise. Drawings of working proprietors are excluded. (d) Sales of goods, commission revenue, repair and service revenue, rent, leasing and hiring revenue, government bounties and subsidies and all other operating revenue except interest, royalties and dividends. (e) Purchases by the enterprise of goods for manufacture or resale, containers, stores and supplies (except office supplies) and charges for fuels, electricity and water, freight and cartage, vehicle running expenses, sales commission expenses, repair and maintenance expenses, and commission and sub-contract expenses. (f) Amount paid for rent and leasing premises, vehicles and equipment. (g) Stocks of materials, fuels, etc. work in progress and finished goods owned by the enterprise. (h) This is derived as turnover plus increase (less decrease) in stocks, less purchases and selected expenses, less rent, leasing and hiring expenses. (i) Outlay on new assets (including progress payments) and land and secondhand fixed tangible assets less disposals. (j) Preliminary estimates and may be subject to revision.

### Foreign ownership and control in the manufacturing industry

Summary information on foreign ownership and control in the manufacturing industry is shown in Chapter 26.

## INTERNAL TRADE

Estimates of the value of retail sales of goods (excluding motor vehicles parts, petrol, etc.) by industry, and quarterly estimates by commodity groups, are obtained by means of sample survey for each State and the Australian Capital Territory. Tables showing estimates derived from these surveys are given below.

### VALUE OF RETAIL SALES OF GOODS (EXCLUDING MOTOR VEHICLES, PARTS, PETROL, ETC.) AT CURRENT PRICES: INDUSTRIES (a) (\$ million)

# DEVELOPMENT OF MANUFACTURING INDUSTRIES IN AUSTRALIA

*(This special article has been contributed by the Bureau of Industry Economics)*

## **1788–1820: the first years of settlement**

In the early years of Australia's settlement, there was little scope for industrial or commercial enterprises. The government, as both main producer and main consumer, established workshops in order to produce the basic necessities of life in a small, isolated community—flour, salt, bread, candles, leather and leather articles, blacksmith's products, tools and domestic items.

With agriculture languishing and commerce in its infancy, private ventures prospered little. The volume of domestic demand was too small to serve as a firm basis for economic development and, generally, was met by imports.

The lack of skilled labour and the small number of free settlers limited severely both the availability of investment funds and business skills generally.

## **1820–1850: the pastoral age**

In the years between 1820 and 1850 the pastoral industry exerted a dynamic influence on economic expansion and by 1850 was supplying well over 50 per cent of the British market for imported wool.

The growth of the wool industry brought great advances in the rest of the economy. Local manufacturing industries were established in response to new market opportunities, though production was geared to the growing agricultural output and, also, was limited to products which were naturally protected from imports.

During the 1840s a severe and protracted depression in the pastoral industry and in the economy as a whole seriously interrupted Australia's economic expansion. Changes in economic conditions in Britain resulted in falls in export prices and reduced capital inflow to Australia. The rate of increase in the production of wool slackened and at the same time the population increase declined.

Despite the depression of the pastoral industry in the 1840s, New South Wales experienced strong industrial growth between 1820 and 1850, arising from a number of factors. These included the rapidly-growing population, which rose from under 13,000 in 1815 to over 180,000 by 1851, greater diversity and level of skills with the influx of free settlers, and the outward spread of settlement. In turn these led to substantial increases in the demand for food and drink, transport equipment, construction materials and other implements.

In other colonies manufacturing developed as circumstances permitted. In Tasmania an emphasis on processing primary produce, a limited local market, a shortage and higher cost of skilled labour and the more immediate rewards from sheep farming and commerce combined to slow the pace of industrial development. Flour milling, ship building and metal working activities were established nevertheless.

Despite its smaller population, industry developed further in South Australia than in Victoria, which was showing few signs of specialisation at this time. Flour milling, metal smelting, brewing and tanning were established in South Australia, and some success was also achieved in the design and manufacture of agricultural equipment. Neither Western Australia nor Queensland experienced any significant industrial activity during this period.

## **The 1850s: implications of the gold rush for manufacturing**

Gold worth \$125 million was mined between 1851 and 1861, surpassing wool as the great export earner—a position it maintained until the 1870s. Banking and commerce expanded rapidly as gold became the nation's currency; financing improved shipping facilities, railways, telegraphs and other amenities. The demand for goods and the clamour for swift passage for eager migrants brought new prosperity to British and American shipyards and revived allied and local trades. For their role in stimulating confidence and activity in a depressed era, the gold fields have been described as 'huge public works'.

## **1860–1900: economic growth leading to structural imbalance and the depression of the 1890s**

In the years between 1860 and 1900 Australian economic growth was rapid and generally well-sustained.

In Victoria, where the gold rush had led to an annual population growth of 19 per cent between 1851 and 1860, there was a rapid increase in factory activity. The building industry was thriving and an increasing demand for gold-mining equipment boosted Victoria's metal working trade. Government incentives encouraged new activities, speculative finance became more available and there was an increase in public works; all were instrumental in fostering industrial growth in the colony.

A protective tariff system against overseas imports was first introduced in Victoria in 1867 in order to encourage the manufacturing industry, as surplus labour became available after the gold rush. In 1871 and again in 1877 there were substantial increases in the tariff, the revenue raised being used primarily to finance public works expenditure.

In New South Wales industry grew at a steady pace and by 1877–78 factory workforce structures in New South Wales and Victoria were similar. Clothing and footwear, metals, engineering and transport, and the food, drink and tobacco industries were major employers in both colonies.

Tasmania and South Australia both experienced long-run declines in manufacturing between 1860 and 1890, but in Queensland and Western Australia the opposite was the case.

Overall, manufacturing demonstrated long-run growth during this period with factory employment increasing from 11,000 in 1851 to 149,000 in 1891 and output increasing from 4.9 per cent of total Gross National Product (GNP) in 1861 to 10.9 per cent in 1890. It was then in fourth place behind services, pastoral activities and construction.

Public companies were establishing multiple branches, industrial activity was spreading to non-metropolitan areas and overseas investors were sharing an interest in activities such as timber milling and meat processing. As well, governments were increasing their own efforts, organising and subsidising the processing industry in recognition of the importance of trade.

Increasing activity in public works, especially government railway construction, played an important role in encouraging expansion in manufacturing during the 1870s. In the second half of the 1880s, capital inflow increased dramatically with overseas loans from Britain underpinning the construction of the railways. In 1890 the Baring crisis prompted Britain to reassess her overseas investments, and in November of that year there was an abrupt halt to the growth in capital inflow which in turn brought railway construction to an unexpected halt.

The process of economic change between 1860 and 1890 left industry's share of total investment unchanged. Manufacturing enterprises remained essentially small-scale, labour intensive and utilising only the simplest technology. Investment in railway building, the pastoral industry, and construction, all of which were funded primarily from overseas sources, ceased with the onset of the depression of the 1890s. The affluence of the previous decades was at an end.

## **1901–1930: from Federation to Depression**

Though the economy recovered rapidly from the depression of the 1890s, the rate of growth for Gross Domestic Product (GDP) in the first thirty years of Federation was significantly lower than it was during the previous thirty years.

Between 1901 and 1930 there were major changes in the industry environment. By eliminating customs barriers between the States, Federation encouraged trade and assisted the further expansion of industry. Though total manufacturing employment had increased from 190,000 in 1903 to 328,000 by 1913, the sector was still relatively small. In 1911 it contributed only 13 per cent of GDP, behind services (55%) and the rural sector (19.9%) and had a limited heavy industry base. Its growth had been supported by tariffs—the Lyne Tariff of 1908 established protection as part of Federal Policy.

The development of Australian manufacturing industry received some further impetus from increases in customs duties in 1911 and 1914, and then grew more strongly in the environment of World War I.

The opening of the steel works at Newcastle during World War I allowed the growth and diversification of basic metal-working industries. However, the shortage of essential capital equipment limited expansion to a narrow range of industrial products.

The years following World War I saw the manufacturing industry expand in an atmosphere of expansionary fiscal policy, high prices for wool and wheat, and with a population which increased from four to six million between 1910 and 1930.

The growth of the manufacturing industry held a promise of employment for a rapidly growing population. In addition, if Australia was to achieve a high degree of self-sufficiency then the existing industrial base needed to be broadened, and the tariff was seen as an important instrument in the achievement of this aim. In 1921, in an endeavor to assist the development of existing and new industries, protection was increased under the Greene Tariff. In the same year, the Tariff Board was established to advise the government on Tariff matters. Protection policy received further attention with the establishment of the Brigden Committee in 1927—set up to conduct an economic inquiry into the tariff. Both bodies recommended that further protection be given only after the most careful consideration. Despite the warning implicit in the recommendation, protection was increased substantially over the decade in order to assist industry development in the face of growing unemployment and external payment difficulties—problems destined to increase during the Depression.

By 1929, 440,000 people were employed in manufacturing—34 per cent above the 1913 level. Until that time more than 60 per cent of manufacturing employment was concentrated in metals and machinery, processed foods, and clothing and textiles, with the latter leading the field in terms of size. However, within manufacturing, average employment was declining steadily in clothing and textiles and rising in metals and machinery and by 1928–29, this latter group had become a major contributor to both the employment and production of the manufacturing sector.

Within the metals and machinery sector, production of motor vehicles and associated activities accelerated during this period, in response to the expanding demand for consumer durables which characterised the 1920s. Holden's Motor Body Builders were well established, the Ford Motor Company opened a large motor body assembly plant at Geelong in 1925, while General Motors commenced operations in Adelaide the following year.

In summary, the increased activity of this period saw Australia's productive capacity significantly broadened under the stimulus of wartime shortages and subsequent tariff protection. But despite the great expansion of output and employment, many of the new industries were able to satisfy only a small proportion of domestic demand.

### **1930–1945: Depression to War's end**

The Depression of the 1930s had its origins overseas although the structural weaknesses of the Australian economy made some contribution. Manufacturing growth in Australia was severely checked in the early years of the decade despite large and widespread increases in ordinary tariff rates in 1930 (the Scullin Tariff).

Though the sector's share of total employment had fallen from 22 per cent in 1920–21 to 18 per cent in 1930–31, manufacturing led the recovery in total employment, accounting for 25 per cent by the start of World War II. Domestic demand continued to grow. Skill levels of the labour force were increasing and overseas enterprises were bringing in new capital. Just as important were the new and sophisticated techniques being introduced, which included the processing of cement and rubber. In 1939 major industries included iron and steel, non-ferrous metals, machinery and engineering, electronic and electrical equipment, motor vehicle assembly and parts, food processing, textiles and clothing, wood products, and printing and publishing.

Some of the pre-1930 trends were continued in the following decade. Industrial metals, machines and conveyances continued to increase their share of manufacturing employment (32%) and value added (32.5%), whilst clothing, food, drink and tobacco continued to decline. By 1938–39 the manufacturing sector's contribution to GDP had reached 19 per cent, a level almost equal to the rural sector's 20 per cent.

When World War II broke out in 1939 the Australian manufacturing sector was sufficiently developed and diversified to respond to the demand for war materials and equipment. Industrialisation proceeded apace as Australia switched her resources to wartime manufacturing production. Key industries expanded and new ones developed rapidly to produce munitions, ships, aircraft, new kinds of equipment and machinery, chemicals, textiles and so on. By 1940–41 manufacturing's share of employment, at 25 per cent, had overtaken the rural sector's share and, combined with the efflux of men and women from the labour force to the armed services, contributed to a sharp fall in unemployment. The resultant acquisition of new skills and development of new strategies and techniques, with subsequent diversification of scientific and technical knowledge, established a firm basis for the growth of the post-war era.

### **1945–1968: post-war years of prosperity**

After World War II Australia entered an era of sustained expansion, with all sectors experiencing growth. Large-scale immigration, increasing availability of raw materials after wartime shortages, technical and scientific progress, and capital inflow all contributed to growth.

Government intervention in the working of the economy became more pronounced, with macro stabilisation policies targeting specific goals such as full employment, growth and economic development. In addition, influence was brought to bear on the location of industries through government regional development policies. After 1945 it was agreed that State governments should promote decentralisation by offering incentives to certain industries, while the Commonwealth further assisted decentralisation through its allocation of defence activities and by encouraging migrants and overseas firms to establish themselves in provincial areas.

With the manufacturing sector seen as a vital element in this process of national development and growth, the protection of the pre-war tariff was continued, and the import licensing restrictions and controls retained until 1960 (apart from a short break after the Korean War wool boom). These measures undoubtedly allowed the domestic manufacturing sector to capture an increased share of the domestic market, reap economies of scale, and improve productivity to more internationally competitive levels.

In this environment, the manufacturing sector made the transition to peacetime activities without undue difficulty, but it was not until the early 1950s that labour and material shortages began to subside, and bottlenecks disappear. Larger-scale immigration, private capital investment and government works, particularly in infrastructure, set the tone for the remainder of the era and allowed rapid expansion. By 1960, manufacturing's share of GDP and employment had reached historic highs, and Australia's industrial base could claim to have reached maturity.

In this period, significant structural change occurred within the manufacturing sector itself. In the traditional, more labour intensive industries such as food, clothing, sawmilling and wood products, the relative share of employment and production declined whilst the more capital intensive groups such as chemicals, electrical goods and industrial metals, machines, and conveyances steadily increased their shares. The growth of these industries was tied to their increasing comparative advantage within the sector, and to the expansion of the domestic market due to rising incomes, high rates of population increase and the unsatisfied demands of the previous era for consumer goods.

The developing maturity of the motor vehicle industry created further demands for steel, glass, plastics and rubber. By 1960, the first indigenous vehicles had been produced and one person in sixteen in the workforce was employed in the manufacture, distribution or servicing sector of this industry.

The petroleum refining industry also grew to prominence in the 1950s to service the needs of both motorists and industry. In the 1960s, new petrochemical complexes using advanced technology were built to transform the by-products of the oil refining process to a variety of petrochemicals and synthetic materials. This basic chemicals industry allowed domestic production of inputs for the further development of the plastics, synthetic fibres and rubber industries and the chemicals, fertilizer, paint, adhesives and sealant industries. Demand for other consumer and producer goods arising in these years provided a challenge for the development of our electronics industries.

The structural changes which occurred during this time were extensive but, when Australia's manufacturing performance is compared with that of other developed countries over a similar time frame, Australia's record was not so impressive, particularly in the 1960s. By this time, the rapid growth afforded by the domestic market in the 1950s had ended, and, although manufacturing exports did increase, the rate of growth was small and compared poorly with other developed countries.

### **1968–1979: years of contrast**

The era of the 1970s saw a sharp transformation in the world economic environment, from the relative stability and high growth of the post-war period to the inflation and low growth which followed the oil price shocks of the 1970s.

The onset of the oil price rises in 1973–74 led the world into recession and added greatly

to inflation, with similar effects on most OECD countries—slower growth of GDPs, employment and trade. This combination of slow growth and inflation became known as stagflation, and affected all sectors of the Australian economy.

### GROSS DOMESTIC PRODUCT AND EMPLOYMENT, BY SECTOR: AUSTRALIA

| Year              | Proportion of total GDP at factor cost (a) attributable to each sector |        |               |          | Proportion of employment in each sector |        |               |          |

What little employment growth there was in this period was dominated by the service sector. While levels of employment changed little in the mining sector, both the manufacturing and the rural sectors experienced substantial declines in employment levels between 1973 and 1980 (by 80,000 and 15,000 respectively). Manufacturing, as the hardest hit sector, saw its sectoral share of total employment fall from 25 per cent in 1970 to slightly less than 20 per cent in 1980, against a background of depressed growth in other sectors.

A number of changes occurred to reduce the competitiveness of local industry in the early 1970s. First, the world wide disturbances in exchange rates following the collapse of the Bretton Woods agreement, increases in oil and other commodity prices, and increasing competition from the newly-industrialised countries in Asia served to undermine Australia's existing comparative advantages. Second, domestic developments such as the move toward equal pay for women, sharp rises in real wage costs generally and tariff cuts compounded the problem, causing a squeeze of rapidly escalating costs and intensified import competition.

Quantitative import restrictions were imposed on those labour intensive goods where domestic employment levels were being severely affected and where overseas competition was rapidly undercutting domestic producers in terms of costs. These were predominantly the textiles, clothing, footwear, automotive and whitegoods industries.

Initially instituted as temporary measures to facilitate adaptation, import quotas were increasingly seen as indispensable to the survival of some local industries. They served to offset to some degree the overall decline in levels of assistance—estimated average effective rates of assistance to manufacturing fell from 36 per cent to 26 per cent in the years between 1968 and 1979, largely as a result of the 25 per cent general tariff cut of July 1973. More importantly, the quota restrictions undermined the reductions in dispersion of assistance across the sector which had been achieved by tariff reductions.

In addition to specific protective policies, the Government instituted an exchange rate devaluation in 1976 which helped to restore competitiveness to the manufacturing sector, but subsequent erosion due to inflation differentials, and reluctance to initiate further devaluation in order to 'fight inflation first', reduced the benefits to industry as the decade wore on.

In the late 1970s expectations of a 'resources boom' gained momentum, partly fuelled by the sustained high prices of energy (such as oil and coal). Investment attention thus swung to the mining sector, reducing the ability of the manufacturing sector to rationalise and make adjustments for a changed world economic environment.

### **1980-1986: declining terms of trade**

Despite significant rationalisation, the manufacturing industry has responded to economic recovery more slowly than other sectors. Its shares of total GDP and employment declined further in the early 1980s, with both falling to 18 per cent in 1983. In 1983-84 the food, beverages and tobacco industry held the largest share of manufacturing output (22%) followed by transport equipment (10%). In 1983-84 the greatest share of manufacturing employment was in food, beverages and tobacco (17%), followed by other machinery and equipment (13%). The textiles, clothing and footwear industry held the smallest share of manufacturing output and employment at this time with 7 per cent and 10 per cent respectively.

Industries based on Australia's natural resources which are capital or skill-intensive, or based on new technology, have continued to experience relatively healthy growth. In the period 1978-79 to 1983-84 the paper, paper products, printing and publishing industry experienced the highest trend annual growth followed by chemical, petroleum and coal products.

Poor prices and market prospects for Australia's traditional exports of agricultural commodities and minerals together with a high level of imports saw a growing current account deficit in the mid-1980s. The need to restructure Australia's export profile if the balance of payments is not to be a continuing constraint on economic growth and, hence, rising living standards, is increasingly clear and acknowledged by most of the community. Australia needs to shift economic resources into the traded goods and services sector. Substantial depreciations of the Australian dollar in 1985 and 1986 provided an important opportunity to boost manufacturing. However, import substitution has been slow, partly due to the erosion of the manufacturing base over the last one and a half decades, and the non-competitive nature of many of Australia's imports. While there have been some signs of exports increasing in response to the devaluation, further large increases in this area will require considerable investment in plant and equipment.

Neither industry nor government expect the increased price competitiveness that has stemmed from the depreciation to be effective, on its own, in bringing about a revitalised manufacturing sector. Approaches and policies which emphasise non-price factors such as quality and marketing are now in evidence and will play an important role.

Recognition of Australia's changing circumstances and the imperative of restructuring the economy has changed industry policy from its former defensive role of reliance on protection against imports to a more positive, catalytic role in renewing the sector. Today's policies seek to deal with root causes of lack of competitiveness (such as outdated technology) rather than its symptom (loss of market share). This is reflected by positive assistance measures such as information and marketing services, programs sponsoring private research and development, and corporate taxation reform.

### **Towards 2000: the prospect for manufacturing**

The future of manufacturing will be determined by a host of factors, many of them inter-related. Government policy will continue to play a significant influence, both in the creation of the economic environment in which business operates, and in specific industry policies. There is large public sector involvement in important economic spheres such as transport, energy, communications and education, and the future of Australian manufacturing will very much depend on the efficient and effective delivery of these services. The extent to which industry adapts to the rapidly changing technological environment, and its ability to recognise and respond to the exigencies of both domestic and international markets, will determine its capacity to achieve international competitiveness.

Industrialisation of Asian countries and the prospect that they will become highly competitive suppliers of an increasing range of goods, implies that a much higher proportion of Australian manufactured products will come under challenge. However, with its large population and rising income, Asia should generate increased demand for Australian products which are internationally competitive.

The availability of capital to finance greater investment will also be important to the growth of the manufacturing industry. The recent deregulation of capital markets, in tandem with government-sponsored venture capital schemes, is expected to diversify the range of finance available for potentially profitable investments.

The Australian manufacturing sector will continue to face pressures for change. Its ability to respond to these pressures will determine its future contribution to economic growth.

## PRICES

## RETAIL PRICES AND PRICE INDEXES

This section summarises briefly the history of retail price collections and the compilation of retail price indexes by the ABS since Federation. It also describes the present Consumer Price Index (CPI) and mentions briefly other statistics of retail prices currently available.

**Retail price collections: historical perspective**

The ABS commenced collecting information on retail prices in 1912, when prices of food and groceries and house rents were collected back to 1901 for the six State capital cities. Those data were used to construct the first retail price index for Australia (in later years called the A Series Index). From 1912 onwards, the collection of retail prices of food and groceries and house rents and the compilation of the (A Series) retail price index was extended to cover 30 'principal towns' (including the six State capital cities).

To supplement the official index relating to the 30 principal towns, between 1913 and the early 1920s, the collection of retail prices of food and groceries and house rents was extended progressively to cover more towns until 200 towns were being covered in 1923. This expanded collection continued annually until 1942 when it was discontinued.

In 1922, collection of retail prices of clothing and a selection of 'miscellaneous goods and services' was commenced in the 30 principal towns, with prices for the six State capital cities being obtained back to 1914. These prices, together with those already being collected for food and groceries and house rents, were used to construct an expanded retail price index (which in later years became known as the C Series Index).

The collection of prices of food and groceries, house rents, clothing and miscellaneous items included in the C Series Index continued on substantially the same basis through the 1920s, 1930s and most of the 1940s. In 1948 the range of items covered in the retail prices collections was expanded considerably in the capital cities and the additional prices were used to construct the new Interim Retail Price Index. The range of items covered in the retail prices collection has been progressively expanded ever since then to support successive expansions of the CPI.

**Australian retail price indexes over the years**

Prior to the introduction of the CPI, five series of retail price indexes had been compiled by the ABS:

- The A Series Index, covering only food and groceries and house rents (all houses), which was first compiled for the six State capital cities in 1912, with index numbers going back to 1901. From 1912 it was compiled for 30 'principal towns' until it was discontinued in 1938. A major use of the A Series Index was for wage adjustment purposes between 1913 and 1933.
- The B Series Index, covering only food and groceries and house rents (4 and 5 roomed houses), which was first compiled in 1925 with index numbers for the six State capital cities, being compiled for selected earlier years back to 1907. It was compiled for 30 principal towns from 1922 until it was discontinued in 1953. The B Series Index was introduced to replace the A Series Index for general statistical purposes but was never used for purposes of wage adjustment.
- The C Series Index, covering food and groceries, house rents (4 and 5 roomed houses), clothing, household drapery, household utensils, fuel, lighting, urban transport fares, smoking and some miscellaneous items, which was introduced in 1921 and discontinued in 1961.

- The food and groceries and rent components of the C Series Index were the same as for the B Series Index. The C Series Index was used for the purpose of wage adjustments from 1934 to 1953.
- The D Series Index, which was derived by combining the A Series and C Series Indexes and was compiled especially for wage adjustment purposes for a short period in 1933–34.
- The Interim Retail Price Index, covering food and groceries, house rent, clothing, household drapery, household utensils, fuel, lighting, urban transport fares, smoking and some services and miscellaneous items, which was first compiled in 1954 and discontinued in 1960. The Interim Index was intended to serve as a transitional index, but to some extent it replaced the C Series Index for general statistical purposes for a number of years prior to 1960; it was never used for wage adjustment purposes.

The most significant of these former retail price indexes was the C Series Index, which was the principal retail price index in Australia for close to forty years. It was first compiled in 1921, with index numbers for the six State capital cities being compiled retrospectively to 1914. The C Series Index was compiled for the 30 principal towns from 1925 onwards and in the 1940s some further towns (including Canberra) were added. The C Series Index was subject to a general review in 1936 and a slightly revised regimen was introduced. The C Series Index regimen then remained unchanged until the index was discontinued.

The main reason for the long interval without any review or change in composition of the C Series Index after 1936 was the recurrent changes in consumption patterns which occurred during and after World War II. It was considered impossible at the time to devise a revised weighting pattern which would be any more representative, on a continuous basis, of post-war consumption than was the existing weighting pattern of the C Series Index.

In 1953 the decision was made to continue to compile the C Series Index on its pre-war basis but to also compile the Interim Retail Price Index based as nearly as possible on the post-war pattern of consumer usage and expenditure. Nevertheless, the C Series Index continued to be regarded by the majority of users as the principal official index and was the one used in most indexation and escalation arrangements throughout the 1950s.

The Interim Retail Price Index was compiled only for the six State capital cities and Canberra. It was based on post-war consumption weights and retained the same weighting pattern throughout the period of its compilation, no attempt being made to revise its weights to take account of major changes in expenditure patterns and lifestyles that were occurring during the 1950s. During that decade, house renting was substantially replaced by home ownership, the use of motor cars partially replaced the use of public transport, and a variety of electrical appliances, and subsequently television, became widely used in households. During the same period, widely disparate movements occurred in the prices of different items of household consumer expenditure. It was considered that the combined impact of these factors made it impracticable to successfully introduce a comprehensive new retail price index during the period to 1960.

In 1960 a new approach was implemented. In place of the former long-term fixed-weight indexes, it was decided to compile series of shorter-term indexes which would be chain linked together to form long-term series. The Consumer Price Index, described later in this chapter, was the first price index of this kind constructed in Australia.

### Long-term linked series

To provide an approximate long-term measure of retail price change for the period since the first Australian retail price index was compiled, a single series of index numbers has been constructed by linking together selected retail price index series from amongst those described above. The index numbers are expressed on a reference base 1945=100.0, which was the end of a period of relative price stability during World War II. The successive series linked together to produce this long-term series of index numbers are:

- from 1901 to 1914, the A Series Index;
- from 1914 to 1946–47, the C Series Index;
- from 1946–47 to 1948–49, a combination of the C Series Index (excluding rent) and the housing group of the CPI;
- from 1948–49 onwards, the CPI.

A considerable range of information on retail prices both in the form of index numbers and average retail prices, for various localities in Australia (in some cases back to 1901) is available in the *Labour Report*, published by the ABS continuously from 1912 to 1973. Various editions of the *Labour Report* also contained detailed descriptions of the methodology used in compiling the various indexes and details of their composition and weighting. A

comprehensive description of the C Series Index, including details of its composition and weighting, was last published in *Labour Report* No. 41 in 1952. Descriptive material on the Interim Retail Price Index was last published in *Labour Report* No. 46 in 1958.

| 1924 | 88           | 1954 | 206          | 1984 | 1,177        |
| 1925 | 88           | 1955 | 211          | 1985 | 1,257        |
| 1926 | 90           | 1956 | 224          | 1986 | 1,370        |
| 1927 | 89           | 1957 | 229          |      |              |
| 1928 | 89           | 1958 | 233          |      |              |
| 1929 | 91           | 1959 | 237          |      |              |
| 1930 | 87           | 1960 | 245          |      |              |

(a) The index numbers relate to the weighted average of six State capital cities up to 1980; from 1981 they relate to the weighted average of eight capital cities.

## Consumer Price Index

The Consumer Price Index (CPI) measures quarterly changes in the price of a 'basket' of goods and services which account for a high proportion of expenditures by metropolitan wage and salary earner households. This 'basket' covers a wide range of goods and services arranged in the following eight groups: food; clothing; housing; household equipment and operation; transportation; tobacco and alcohol; health and personal care; and recreation and education. The eight groups in turn are divided into 35 sub-groups and 107 expenditure classes.

From its inception in 1960, the CPI covered the six State capital cities. In 1964 the geographical coverage of the CPI was extended to include Canberra. From June quarter 1982 geographic coverage was further extended to include Darwin.

Index numbers at the Group and All Groups levels are published for each capital city and for the weighted average of eight capital cities. Sub-group index numbers are published for the weighted average of eight capital cities.

## Conceptual basis for measuring price changes

The CPI is a quarterly measure of the change in average retail price levels. It provides a method of comparing the average price level for a quarter with the average price level of the reference base year or changes in the average price level from one quarter to the next. In measuring price changes, the CPI aims to measure only pure price changes (i.e. price changes excluding the effects of any changes in the quality or quantity of the goods or services concerned)—in other words to measure, each quarter, the change in the cost of purchasing an identical basket of goods and services. The CPI is a measure of changes in transaction prices—the prices actually paid by consumers for the goods and services they buy. It is not concerned with nominal, recommended or list prices (unless they are the prices consumers actually pay).

The CPI is often loosely, and incorrectly, referred to as a cost-of-living index. However, a true cost-of-living index (if such a measure could be compiled) would not be the same thing as a fixed-weight retail price index like the CPI. A cost-of-living index would need to take account of changes in standards of living and the substitutions that consumers make in response to changing market conditions, such as changes in supply, or in response to disparate price movements.

The CPI measures price change over time and does not provide comparisons between relative price levels at a particular date. For example, it does not show whether beef is dearer than lamb, or whether bus fares are dearer than train fares. The fact that the index number for any particular component is higher than that for another component in a particular quarter does not mean that the first component is more expensive than the second—it merely means that, since the reference base year, prices for the first component have risen more than prices for the second component. Similarly, the CPI does not provide any basis for measuring relative price levels between the different cities. For example it says nothing about whether prices are higher in Sydney or Perth—it shows only whether prices have changed more in Sydney or in Perth.

## Index population

Because the spending patterns of various groups in the population differ somewhat, the pattern of one large group, fairly homogeneous in its spending habits, is chosen for the purpose of calculating the CPI. The CPI population group is, in concept, metropolitan employee households. For this purpose employee households are defined as those households which obtain the major part of their household income from wages and salaries; metropolitan means the eight capital city Statistical Divisions.

## Weighting pattern

Each of the 107 expenditure classes in the current CPI has a fixed weight (i.e. the measure of its relative importance). Details of the weighting pattern are shown in the table on page 683. More detailed information on weighting is published in *The Australian Consumer Price Index: Concepts, Sources and Methods* (6461.0).

Changes in the weighting pattern have been made at approximately five-yearly intervals to take account of changes in household spending patterns. The CPI, in fact, comprises eleven separate series which have been linked to form a continuous series. The eleventh series (i.e. the current series) was introduced in the March quarter 1987, with a weighting pattern based on estimated household expenditure in 1984.

The CPI 'basket of goods and services' covers items which are considered representative of metropolitan households' spending habits and whose prices can be associated with an identifiable and specific quantity of a commodity or service. Income taxes and personal savings, on the other hand, do not form part of the CPI because they cannot be clearly associated with the purchase of a specific quantity of any goods or services.

## Collecting prices

Since the CPI is designed to measure the impact of changing prices on metropolitan wage and salary earner households, price movements are monitored in the kinds of retail outlets or other establishments where such households normally purchase goods and services. This involves collecting prices from many sources including supermarkets, department stores,

footwear stores, restaurants, motor vehicle dealers and service stations, dental surgeries, hotels and clubs, schools, hairdressers, travel agents, airlines, bus operators, house builders, real estate developers, electricians and plumbers. Items such as bus, rail and air fares, electricity and gas charges, telephone charges and local authority rates are collected from the appropriate authorities. Information on rents is obtained from property management companies and government housing authorities. In total, around 100,000 separate price quotations are collected each quarter.

Prices of the goods and services included in the CPI are generally collected quarterly. However, some important items are priced monthly or more frequently (e.g. bread, fresh meat and fish, fresh fruit and vegetables, petrol, alcohol and tobacco) and a small number are collected annually (e.g. seasonal clothing, local government rates and charges).

The bulk of items for which prices are collected quarterly are priced at the middle of the mid-month of the quarter (i.e. in August, November, February and May), but, to facilitate a more even spread of the field collection workload, some goods and services are priced in the first or third months of each quarter. Items priced in the third month are generally those subject to price changes at discrete points of time (e.g. electricity and postal charges); in these cases information is obtained of any changes in price during the quarter so that an average price for the whole quarter can be calculated.

The prices used in the CPI are those that any member of the public would have to pay on the pricing day to purchase the specified good or service. Any sales or excise taxes which the consumer must pay when purchasing specific items are included in the CPI price. Sale prices, discount prices and 'specials' are reflected in the CPI so long as the items concerned are of normal quality (i.e. not damaged or shop soiled) and are offered for sale in reasonable quantities. To ensure that the price movements reflect the experience of the bulk of the metropolitan population, the brands and the varieties of the items which are priced are generally those which sell in greatest volume.

### **Changes in quality**

Since the CPI aims to measure the price change of a constant basket of goods and services over time it is necessary to ensure that identical or equivalent items are priced in successive time periods. This involves evaluating changes in the quality of goods and services included in the index and removing the effects of such changes so that the index reflects only the price change.

### **Treatment of home ownership costs**

Although various changes have been made in the composition of the CPI since it was first introduced, for most of this time the index has remained fundamentally the same. However, a significant change in the basis of compilation of the CPI was made in 1987 when a new method of representing home ownership costs was introduced.

Up to the end of 1986, the main item included in the CPI to represent home ownership costs was the cost of purchasing houses—which was represented by new house prices. Other items included were local government rates and charges, house repairs and maintenance and house insurance. From March quarter 1987 the cost of purchasing houses was deleted from the CPI regimen and the cost of housing mortgage interest charges was included. The other three items continued to be included on the same basis as previously. A detailed explanation of the reasons for this significant change in the composition of the CPI is given in a special ABS information paper, *The Australian Consumer Price Index: Treatment of Home Ownership Costs* (6441.0), published in March 1987.

### **Periodic revision of the CPI**

The CPI is periodically revised in order to ensure it continues to reflect current conditions. CPI revisions have usually been carried out at approximately five-yearly intervals, the most recent having been completed in March 1987. Previous revisions of the CPI were introduced at: December quarter 1963; December quarter 1968; December quarter 1973; September quarter 1974; September quarter 1976; and March quarter 1982. Following each revision, the

new series with its changed composition and weighting pattern, is linked to the previous series to form one continuous series. The process of linking ensures that the continuous series reflects only price variations and not differences in costs of the old and new baskets.

Some additional information about the CPI is contained in a booklet entitled *A Guide to the Consumer Price Index* (6440.0). A detailed and comprehensive description of the CPI is published in *The Australian Consumer Price Index: Concepts, Sources and Methods* (6461.0).

(a) The composition of these indexes varies considerably in the various countries. The index numbers show changes in prices in each country over time and do not measure relative price levels between countries. (b) Consumer Price Index (All Groups) converted to base: 1980 = 100.0.

### Average retail prices

Average retail prices for a range of selected (mainly food) items have been published regularly since 1901. Since 1962, data on average retail prices in each of the capital cities have been published quarterly in *Average Retail Prices of Selected Items* (6403.0). Prior to that date information was published annually in the annual *Labour Report* (now discontinued).

### Experimental indexes of relative retail prices of food

Since 1962 the ABS has conducted an annual survey of food prices in approximately 200 cities and towns throughout Australia. Information from this survey is used to compile index numbers measuring the relative levels of food prices in the different localities at the time the survey is conducted (currently in May each year). The index numbers are produced by combining the prices for the selected food items using a common set of weights (derived from the weighting pattern of the CPI Food Group). The resulting index numbers are expressed on the base: Weighted Average of Eight Capital Cities=100.

Index numbers for Queensland localities are published by the ABS Queensland office (6401.3). Index numbers for localities in other States are available from the ABS on request.

## PRODUCER AND WHOLESALE PRICE INDEXES

### Historical perspective

The first price index of this kind compiled by the ABS was the Melbourne Wholesale Price Index which was introduced in 1912 with index numbers compiled back to 1861 from prices extracted from newspapers and trade publications. Index numbers were compiled up to 1961. The index related chiefly to basic materials and foods weighted in accordance with consumption in about the year 1910 and neither the list of items nor the weighting was varied during the life of the index. A description of the index and a list of the commodities included was last published in *Labour Report* No. 38, 1949.

The next index published was the Wholesale Price (Basic Materials and Foodstuffs) Index which was introduced in 1939; index numbers are available for the period 1928 to 1970. The index related to commodities in their basic or primary form and prices were obtained as near as possible to the point where they made their first effective impact on the local price structure. With few exceptions, prices were obtained from Melbourne sources. The weights were based on estimates of the average annual consumption of the commodities in Australia during the period 1928-29 to 1934-35 inclusive. A list of the commodities and other information concerning the index was last published in *Labour Report* No. 53, 1967.

During the 1960s the ABS began producing a range of price indexes covering materials used and articles produced by defined sectors of the Australian economy. The following indexes are now published monthly:

- Price Index of Materials Used in House Building
- Price Index of Materials Used in Building Other than House Building
- Price Indexes of Materials Used in Manufacturing Industries
- Price Indexes of Articles Produced by Manufacturing Industry.

Prices are collected from representative suppliers or manufacturers of the materials or articles included in the indexes. Mid-month prices are generally used to compile the two building materials indexes and the Price Indexes of Articles Produced by Manufacturing Industry. Average monthly prices are mainly used to compile the Price Indexes of Materials Used in Manufacturing Industries.

A table giving a broad indication of long-term price changes, drawing on the producer and wholesale price indexes available, is given below on a common reference base: Year 1968-69 = 100.0. The Melbourne Wholesale Price Index and the Wholesale Price (Basic Materials and Foodstuffs) Index have been linked at 1928-29 to provide a continuous series.

## Price Index of Materials Used in House Building

The Price Index of Materials Used in House Building was first compiled on a reference base 1966-67 = 100.0, using a weighting pattern derived from estimated material usage in 1968-69. Monthly index numbers on a 1966-67 = 100.0 reference base are available for the period July 1966 to September 1986. A detailed description of the first series, including its composition and weighting pattern, is given in the September 1970 issue of the publication *Price Index of Materials Used in House Building* (6408.0) and in *Labour Report* No. 55, 1970.

The current Price Index of Materials Used in House Building, on a reference base 1985-86 = 100.0, was introduced in October 1986 and linked to the previous series. The items included, and their weights, were derived from reported values of each material used in selected representative houses constructed in 1985-86. Further information concerning the method of compiling the index, including details of its composition and weighting pattern, is given in the October 1986 issue of the publication *Price Index of Materials Used in House Building* (6408.0).

(a) The separate city indexes measure price movements within each city individually. They do not compare price levels between cities.  
(b) The index series for years prior to 1985-86 are based on the series previously published on a reference base 1966-67 = 100.0. They have been converted to reference base 1985-86 = 100.0 by linking the old and new series at September 1986.

### Price Index of Materials Used in Building Other than House Building

The Price Index of Materials Used in Building Other than House Building was first compiled on a reference base 1966-67 = 100.0, using a weighting pattern derived from estimated materials usage in 1966-67. Monthly index numbers on a 1966-67 = 100.0 reference base are available for the period July 1966 to January 1981. A description of the first series, including its composition and weighting pattern, is given in the publications *Price Index of Materials Used in Building Other than House Building*, January 1969 (6407.0) and *Labour Report* No. 54, 1969.

The current Price Index of Materials Used in Building Other than House Building for the six State capital cities was introduced in February 1981 on reference base 1979-80 = 100.0. The index for Darwin was published for the first time in September 1982 on a reference base 1981-82 = 100.0.

This index measures changes in prices of selected materials used in the construction of buildings other than houses. Its composition reflects the usage of materials in the construction of buildings (other than houses) commenced in the three years ending June 1977.

Further information concerning the method of compiling the index, including details of its composition and weighting pattern can be obtained from the February 1981 and the September 1982 issues of the publication *Price Index of Materials Used in Building Other than House Building—Six State Capital Cities and Darwin* (6407.0).

The tables below show annual 'All groups' index numbers for each State capital city and Darwin and index numbers for selected building materials for the weighted average of six State capital cities. Monthly index numbers for selected materials and special combinations of materials are shown in each issue of the monthly price index publication *Price Index of Materials Used in Building Other than House Building—Six State Capital Cities and Darwin* (6407.0).

(a) The separate city indexes measure price movements within each city individually. They do not compare price levels between cities.  
(b) The index series for years prior to 1979-80 are based on the series previously published on a reference base 1966-67=100.0. They have been converted to the reference base 1979-80=100.0 by linking the old and new series in the year 1979-80.

### Price Indexes of Materials Used in Manufacturing Industries

The Price Index of Materials Used in Manufacturing Industry was first compiled on a reference base 1968-69=100.0, using a weighting pattern derived from estimated manufacturing usage in 1971-72. Monthly index numbers on a 1968-69=100.0 reference base are available for the period July 1968 to November 1985. A description of the first series, including its composition and weighting pattern, is given in the April 1975 issue of the publication *Price Index of Materials Used in Manufacturing Industry* (6411.0).

The current Price Indexes of Materials Used in Manufacturing Industries were introduced in December 1985 on a reference base 1984-85=100.0. Details of their composition and weighting pattern are given in the December 1985 issue of the publication *Price Indexes of*

*Materials Used in Manufacturing Industries* (6411.0). With a few exceptions the items included in the indexes were allocated weights in accordance with the estimated value of manufacturing usage in 1977-78.

These indexes measure changes in prices of materials (including fuels) used by establishments classified to the Manufacturing Division of the Australian Standard Industrial Classification 1983 (ASIC). The indexes are on a net 'sector' basis; that is, each relates only to those materials which are used in the defined sector of Australian manufacturing industry and which have been produced by establishments outside that sector. The following sector price indexes are published:

- (i) a net index for the Manufacturing Division of ASIC; and
- (ii) net indexes for ten sub-divisions and four groups within the Manufacturing Division.

In addition, indexes are published for selected categories of materials, some of which are presented below.

**PRICE INDEXES OF MATERIALS USED IN MANUFACTURING INDUSTRIES (a):  
SELECTED CATEGORIES OF MATERIALS**  
(Base of each index: Year 1984-85 = 100.0) (b)

|                   | <i>Imported materials</i> |               |                      | <i>Home produced materials</i>  |                                           |               |                    |                                      | <i>All materials</i> |
|-------------------|---------------------------|---------------|----------------------|---------------------------------|-------------------------------------------|---------------|--------------------|--------------------------------------|----------------------|
|                   | <i>Agricultural</i>       | <i>Mining</i> | <i>Manufacturing</i> | <i>Total imported materials</i> | <i>Agricultural, forestry and fishing</i> | <i>Mining</i> | <i>Electricity</i> | <i>Total home produced materials</i> |                      |
| 1976-77 . . . . . | 69.8                      | 34.4          | 51.3                 | 45.3                            | 48.6                                      | 33.5          | 41.1               | 42.1                                 | 43.2                 |
| 1977-78 . . . . . | 81.9                      | 37.0          | 56.8                 | 49.9                            | 51.4                                      | 37.4          | 44.5               | 45.6                                 | 47.0                 |
| 1978-79 . . . . . | 77.0                      | 39.0          | 62.6                 | 53.5                            | 71.5                                      | 49.9          | 48.0               | 61.6                                 | 58.9                 |
| 1979-80 . . . . . | 88.8                      | 65.5          | 73.8                 | 71.1                            | 87.5                                      | 71.3          | 51.6               | 78.7                                 | 76.2                 |
| 1980-81 . . . . . | 79.2                      | 82.3          | 78.5                 | 80.2                            | 92.6                                      | 80.4          | 58.1               | 85.4                                 | 83.7                 |
| 1981-82 . . . . . | 71.4                      | 89.6          | 81.9                 | 84.6                            | 88.5                                      | 83.6          | 70.0               | 85.3                                 | 85.0                 |
| 1982-83 . . . . . | 81.9                      | 94.7          | 87.5                 | 90.2                            | 90.6                                      | 95.8          | 92.3               | 92.8                                 | 91.9                 |

| 1985-86 . . . . . | 117.3                     | 91.5          | 117.7                | 111.8                           | 100.6                                     | 101.4         | 102.9              | 101.2                                | 104.9                |

(a) The index is on a net basis and relates in concept only to materials that enter Australian manufacturing industry from other sectors of the Australian economy or from overseas. (b) The index series for years prior to 1984-85 are based on the series previously published on reference base 1968-69 = 100.0. They have been converted to reference base 1984-85 = 100.0 by linking the old and new series in the year 1984-85.

## Price Indexes of Articles Produced by Manufacturing Industry

These indexes measure changes in the prices of articles produced by establishments classified to the Manufacturing Division of the Australian Standard Industrial Classification (ASIC). Indexes are on a 'net basis', i.e. they relate in concept only to those articles which are produced in defined sectors of Australian manufacturing industry for sale or transfer to other sectors or for export or for use as capital equipment. Articles which are sold or transferred to other establishments within the sector for further processing as materials, components, fuels, etc. are excluded.

The following sector price indexes are published:

- (i) a net index for the Manufacturing Division of ASIC (known as the *All Manufacturing Industry Index*), and
- (ii) a net index for each of the twelve sub-divisions within the Manufacturing Division.

The reference base of the indexes is the year 1968-69 = 100.0. Their composition and weighting reflect estimated net sector production in the year 1971-72.

The items included in the indexes are combined for publication purposes using the structure of ASIC.

Further information concerning the method of compiling monthly index numbers for each index, including details of their composition and weighting, is shown in the June 1976 issue of the publication *Price Indexes of Articles Produced by Manufacturing Industry, Australia* (6412.0). Further information about the indexes is also shown in *Year Book* No. 62.

(a) For a full description of Division C, 'Manufacturing' and the subdivisions within the Manufacturing Division, see *Australian Standard Industrial Classification (ASIC), Preliminary Edition, 1969*. (b) These indexes are on a net subdivision basis; the index for each subdivision relates in concept to articles which are produced in that subdivision for sale or transfer outside the subdivision. (c) This index is on a net division basis and relates in concept only to articles which are produced in the Manufacturing Division of ASIC for sale or transfer outside the Division.

## FOREIGN TRADE PRICE INDEXES

## Historical perspective

## Export Price Index

An index of export prices has been published by the ABS since 1901. The first index was compiled annually from 1901 to 1916-17 as a current weighted unit value index.

The method of calculation was changed in 1918 to incorporate fixed weights. Weights for all principal exports were calculated based on the average quantities of exports for the period January 1897 to June 1916. These weights were applied to the average unit values of each export in successive years, and a weighted average index of 'price' movements was derived. This index was published for the years 1897 to 1929-30.

An index of export prices was not published again until 1937 when two new series of monthly export price indexes were published, compiled back to 1928. One index used fixed weights and the other used changing weights. The most important methodological change introduced with these indexes was the use of actual export prices in place of unit values. The indexes were compiled until 1962.

The next index was introduced in August 1962 with index numbers compiled back to July 1959. This was a fixed weights index with reference base 1959-60 = 100.0. The weights

were based on the average annual value of exports during the five years 1956-57 to 1960-61. By 1969-70 there had been a substantial shift in the relative importance of commodities exported and from July 1969 a new interim series was linked to this index, still with reference base 1959-60 = 100.0, but using weights based on the annual value of exports in 1969-70. Four new commodities iron ore, bauxite, alumina and mineral sands were included. The interim index was published until June 1979 when it was replaced by the current Export Price Index.

### Import Price Index

The first issue of the Import Price Index produced by the ABS was released in May 1983 with index numbers compiled from September quarter 1981 onwards, on a reference base 1981-82 = 100.0. This index replaced an import price index previously published by the Reserve Bank of Australia on a reference base 1966-67 = 100.0. The Reserve Bank's import price index was published from 1928 until September 1982.

A table giving a broad indication of long term price changes, drawing on the foreign trade price indexes available, is given below.

#### FOREIGN TRADE PRICE INDEXES

(Reference base: Year 1968-69=100)

Source: The sources used for the Import Prices Index are the *Reserve Bank of Australia Bulletin* up to and including 1981-82, and the *ABS Import Price Index* (6414.0) thereafter.

### Current indexes

The ABS compiles price indexes for merchandise imported into and exported from Australia. The Export Price Index is compiled and published monthly while the Import Price Index is compiled and published quarterly. Both indexes are calculated using fixed weights. Prices are collected from representative importers or exporters of the goods included in the indexes. Average monthly prices are used to compile the Export Price Index and average quarterly prices are used to compile the Import Price Index. Published index numbers for financial years are simple averages of the relevant monthly or quarterly index numbers. Annual index numbers for these indexes are shown below.

### Import Price Index

The Import Price Index measures changes in prices of 'imports of merchandise' into Australia. The index numbers for each quarter relate to prices of imports landed in Australia during the quarter.

The commodities directly represented in the index were selected on the basis of their import values and were allocated weights in accordance with the average value of imports for each commodity over the three years ended June 1981.

The selected commodities are combined for publication purposes into broad index groups using three different classifications:

- (i) Australian Import Commodity Classification (AICC) 1980-81 (1204.0)
- (ii) Australian Standard Industrial Classification (ASIC) 1978 (1201.0)
- (iii) United Nations Classification by Broad Economic Categories (BEC) 1976

In addition, BEC categories have been rearranged to form the broader end use classes: Capital goods, Intermediate goods and Consumption goods. Index numbers based on AICC and BEC are presented below.

Further information concerning the method of compiling the index, including details of its composition and weighting pattern, can be obtained from the December quarter 1982 issue of the publication *Import Price Index* (6414.0). More detailed index numbers are shown in the quarterly publication *Import Price Index, Australia* (6414.0).

## Export Price Index

The current Export Price Index was introduced in July 1979. It relates to 'all exports of merchandise' from Australia. The index numbers for each month relate to prices of those exports of merchandise that are physically shipped from Australia during that month.

The reference base of the index is the year 1974-75 = 100. The commodities directly represented in the index were selected on the basis of their export values and were allocated weights in accordance with the average value of exports for each commodity over the three years ended June 1977.

The selected commodities are combined for publication purposes into broad index groups using two different classifications:

(i) Australian Export Commodity Classification (AECC) 1978-79 (1203.0)

(ii) Australian Standard Industrial Classification (ASIC) 1978 (1201.0)

Further information concerning the method of compiling the index, including details of its composition and weighting pattern, can be obtained from the July 1979 issue of the publication *Export Price Index* (6405.0). More detailed index numbers are shown in the monthly publication *Export Price Index, Australia* (6405.0).

## CHAPTER TWENTY

# HOUSING AND CONSTRUCTION

## HOUSING

### AN HISTORICAL PERSPECTIVE

To own one's own home has long been the ultimate goal of most Australians.

While home ownership has obvious benefits for the owner, it is also beneficial to the government. Governments see an adequately housed population as being more politically and economically stable, healthy and productive. Additionally, a healthy housing construction industry provides substantial employment both within the industry and in associated sectors of the economy—notably in banking, the real estate industry and manufacturing. It is no accident that Australia has the highest rate of private home ownership per head of population in the world. This has come about as a result of a variety of government initiatives and policies since Federation.

The need for housing and construction statistics has developed with these initiatives to the point where Australia's statistics are quite comprehensive. Of course, user requirements change with government policy changes, and more and different data will always need to be developed.

An historical perspective of Australia's housing statistics is presented below. More detailed current statistics are shown later in this chapter.

### New dwelling statistics

These statistics were first collected in 1946-47 to provide data on expenditure on dwellings for inclusion in the Bureau's quarterly national accounts. This survey was one of several commenced around that period as the national accounts statistical system was developed.

The following tables and graphics provide an historical national perspective on the number of dwelling units approved from 1954-55 to 1986-87 together with dwelling commencements and completions from 1946-47 to 1986-87.

More detailed current data appear later in this chapter.

### NUMBER OF NEW DWELLING UNITS, AUSTRALIA

## Census dwellings

At each census of the population, in addition to the questions relating to personal particulars, there have been a number of questions relating to dwellings. A 'dwelling' is defined as any habitation occupied by a household group living together as a domestic unit, whether comprising the whole or only part of a building, and includes, in addition to houses and self-contained flats, a great variety of dwellings ranging from a single-roomed shack to a multi-roomed hotel or institution. This section contains particulars of such information on dwellings as is available from the 1986 Census, together with information from earlier censuses.

Extensive information on dwellings obtained from censuses is available in the detailed tables of the publications issued for each individual census. A list of the 1986 Census publications is shown in the *ABS Catalogue of Publications, Australia* (1101.0). The most relevant 1986 Census publication is *Census 86—Summary Characteristics of Persons and Dwellings* (2479.0-2487.0). More detailed dwellings information is available on microfiche. Tables are listed in the *Catalogue of 1986 Census Tables* (2175.0).

## Number of dwellings

The following table shows the number of occupied and unoccupied dwellings in Australia at each census from 1954 to 1986. Occupied dwellings are classified into 'private', 'caravans, etc. in caravan parks' and 'non-private' dwellings.

Private dwellings were classified by the census collector for the 1986 Census; collectors allocated each dwelling to one of the following categories:

- Separate house*
- Semi-detached house*
- Row or terrace house*
- Medium density housing*
- Flat, unit in building, over three storeys*
- Caravan, tent, cabin, etc. in caravan park*
- Caravan not in caravan park, houseboat, etc.*
- Improvised home*
- House or flat attached to a shop, office, etc.*

Caravans, etc. in caravan parks were treated as separate households in the 1986 Census. Previously, each caravan park was treated as a non-private dwelling.

Non-private dwellings include hotels, motels, boarding houses and hostels, educational, religious and charitable institutions, hospitals, defence and penal establishments, staff barracks and quarters, etc.

An unoccupied dwelling is defined as a structure built specifically for private living purposes and which is habitable though unoccupied at the time of the census. The total number of unoccupied dwellings shown for any area does not represent the number of vacant dwellings available for sale or renting.

#### DWELLINGS (a): AUSTRALIA: CENSUS YEARS

| Census     | Occupied  |                               |                 | Total        | Unoccupied |
|------------|-----------|-------------------------------|-----------------|--------------|------------|
|            | Private   | Caravans in caravan parks (b) | Non-private (b) |              |            |
| 1961 . . . | 2,781,945 | n.a.                          | 35,325          | 2,817,270    | 194,114    |
| 1966 . . . | 3,155,340 | n.a.                          | 33,917          | 3,189,257    | 263,873    |
| 1971 . . . | 3,670,553 | n.a.                          | 24,006          | 3,694,559    | 339,057    |
| 1976 . . . | 4,140,521 | n.a.                          | 21,543          | 4,162,064    | 431,200    |
| 1981 . . . | 4,668,909 | n.a.                          | 22,516          | 4,691,425    | 469,742    |
| 1986 . . . | 5,264,516 | 77,094                        | 21,055          | (c)5,285,571 | 543,539    |

(a) Excludes dwellings occupied solely by Aborigines before 1966. (b) Prior to the 1986 Census, caravan parks were classified as non-private dwellings. Therefore, 1986 Census non-private dwelling counts are not comparable with previous censuses. (c) Excludes caravans, etc. in caravan parks.

The total number of occupied and unoccupied dwellings in each State and Territory at the Censuses of 1981 and 1986 were as follows:

#### DWELLINGS, BY STATE: CENSUS YEARS

| State or Territory                     | Census 30 June 1981 |                | Census 30 June 1986 |                |
|----------------------------------------|---------------------|----------------|---------------------|----------------|
|                                        | Occupied(a)         | Unoccupied     | Occupied(a)(b)      | Unoccupied     |
| New South Wales . . . . .              | 1,669,594           | 153,251        | 1,839,308           | 174,467        |

| Northern Territory . . . . .           | 29,563              | 2,368          | 43,235              | 3,639          |
| Australian Capital Territory . . . . . | 68,740              | 3,963          | 79,731              | 5,588          |
| <b>Australia . . . . .</b>             | <b>4,691,419</b>    | <b>469,742</b> | <b>5,285,571</b>    | <b>543,539</b> |

(a) Includes non-private dwellings. (b) Excludes caravans, etc. in caravan parks.

### Commonwealth and State Government housing assistance

One of the Commonwealth's major objectives is to ensure that every Australian has adequate and appropriate accommodation at a price within his or her means. A range of assistance programs has been developed to target assistance to households in the owner-occupied, public

**DWELLING STATISTICS AT CENSUSES**

**OCCUPIED PRIVATE DWELLINGS OWNED OR BEING PURCHASED**

DWELLING STATISTICS AT CENSUSES

NUMBER OF PERSONS PER OCCUPIED PRIVATE DWELLING

PRIVATE DWELLINGS OCCUPIED

PERSONS IN PRIVATE DWELLINGS

housing and private rental housing sectors. The Government provides funds for public housing, supported accommodation services, crises accommodation, mortgage and rent relief, home purchase loans and home purchase subsidies to individuals and families.

The bulk of Commonwealth financial assistance for housing is provided through the First Home Owners Scheme (FHOS) and the Commonwealth-State Housing Agreement (CSHA).

### First Home Owners Scheme

The First Home Owners Scheme was introduced on 1 October 1983. Applications for assistance under the *First Home Owners Act 1983* may be made by persons who contract to buy or build or who commence constructing their first home in Australia on or after 1 October 1983. There is no restriction on the marital status or age of the applicant. The home must be intended as the applicants' principal place of residence. At least one applicant must be an Australian citizen or must have the right to reside here permanently. Applicants cannot have owned a home in Australia previously, received assistance under the First Home Owners Scheme, or a grant under the Home Savings Grant Scheme or Home Deposit Assistance Scheme.

The income limits for a home acquired after 31 March 1987 are shown below.

#### INCOME LIMITS

(\$)

|                                                                        | <i>Lower</i> | <i>Upper</i> |
|------------------------------------------------------------------------|--------------|--------------|
| Sole or joint applicants with two or more dependent children . . . . . | 26,000       | 34,000       |
| Sole or joint applicants with one dependent child . . . . .            | 25,000       | 33,000       |
| Joint applicants without dependent children . . . . .                  | 23,000       | 31,000       |
| Sole applicants without dependent children . . . . .                   | 11,500       | 15,500       |

The amount of assistance payable relates directly to the amount of taxable income of all the applicants. The income to be tested is, generally, the taxable income for the year before home acquisition. In certain circumstances income for the current financial year may be tested. New arrivals will be tested against income in the first full year as a taxpayer.

#### MAXIMUM ASSISTANCE AVAILABLE AND OPTIONS FOR HOMES ACQUIRED FROM 1 OCTOBER 1983 TO 16 APRIL 1985

| Subsidy . . . . .      | 2,300                | 3,800                | 3,800                         |
| Lump Sum . . . . .     | 1,200                | 1,200                | 1,700                         |
| Option 3—              |                      |                      |                               |
| Subsidy . . . . .      | 1,250                | 2,250                | 2,250                         |
| Lump Sum . . . . .     | 2,000                | 2,500                | 3,000                         |

The subsidy is paid monthly, generally over five years, into a financial institution loan account. The lump sum is paid with the first monthly payment or, where requested, by early direct payment for deposit assistance or for settlement.

During the five year subsidy period the home must continue to be the applicant's principal place of residence. The subsidy will cease upon the sale of the home, but may recommence if a subsequent home is acquired within 12 months of the sale of the first home.

The following table sets out the operations of the scheme from 1 July 1986 to 30 June 1987.

**FIRST HOME OWNERS SCHEME: OPERATIONS 1986-87**

| State                                  | Number of applications |               | Amount of benefit approval (\$'000) | Amount of benefit paid (\$'000) |
|----------------------------------------|------------------------|---------------|-------------------------------------|---------------------------------|

### 1984 Commonwealth-State Housing Agreement—CSHA

The 1984 CSHA came into operation on 1 July 1984 following the renegotiation of the 1981 Agreement. The Agreement is set to run for a 10 year period with triennial reviews. Financial assistance under the 1984 Agreement is to be provided as a combination of grants and loans with at least 75 per cent to be provided as grants. Since 1984-85, all assistance was provided as grants. Each State decides on the distribution of untied funds between home purchase and rental housing assistance and is required to match these funds on a dollar for dollar basis with funds provided from their own resources.

The Commonwealth guaranteed a minimum level of funding of \$530 million in 1984-85 and \$510 million for 1985-86 and 1986-87. The base level funding has been increased to \$700 million in 1987-88 and a minimum of at least this amount will be provided in 1988-89 and 1989-90. Total funding each year is determined in the Budget context. Total funding under the 1984 CSHA in 1987-88 is \$700.0 million, comprising \$550.0 million in 'untied' grants, \$37.5 million for pensioners, \$60.0 million for Aboriginals, \$25.0 million for the Mortgage and Rent Relief Scheme, \$15.5 million for the Crisis Accommodation Program and \$12.0 million for the Local Government and Community Housing Program.

In addition to direct CSHA funding, since 1982-83 the States and the Northern Territory have been able to nominate further funds for public housing from their Loan Council allocations. A total of \$584.7 million was nominated by the States in 1986-87, and in 1987-88 the States and the Northern Territory are entitled to nominate up to a maximum of \$414.0 million. These additional funds are provided, subject to States matching the untied funds (\$550.0 million in 1987-88), and are made available at the highly concessional interest rate of 4.5 per cent per annum over a 53 year period.

The Commonwealth Government is continuing to implement the major principles incorporated in the 1984 CSHA which focus on alleviating housing related poverty and achieving equitable distribution of housing assistance between tenures.

The first triennial evaluation of the 1984 Agreement was undertaken during 1986-87—the final year of the first triennium. The terms of reference stated that the evaluation would examine the effectiveness of CSHA rental and home purchase assistance programs and the use of CSHA funds, against the principles set out in the Agreement.

The following key issues were considered during the triennial evaluation:

- base level funding;
- State nomination of Loan Council borrowings for public housing;
- matching arrangements;
- accountability and use of revolving funds;

- allocation of funds between home purchase and rental assistance;
- funding of rent rebates;
- distribution of funds between States;
- specific purpose programs and co-ordination of programs;
- tenant participation;
- cost rents;
- home purchase assistance arrangements.

As a result of the evaluation, a number of changes are being made to the Agreement and program guidelines. Key changes are:

- tightening provisions for accountability and use of Loan Council funds to ensure that all revolving funds arising from these loans remain in public housing;
- ensuring States adhere to the non-discrimination principles of the Agreement by adding a specific requirement that young, single people be admitted to waiting lists;
- revising consultative arrangements for the Aboriginal rental program to ensure a greater federal role in establishing priority for Aboriginal housing;
- requiring States to allocate not less than 50 per cent of total funds for public rental housing from 1987-88;
- standardising income review and recoupment of interest subsidies under the home purchase assistance arrangements.

### Home purchase assistance

Funds available under the CSHA for home purchase assistance comprise Commonwealth funds, revolving funds arising from the operation of previous home purchase programs and State funds. These funds are used principally to make loans to co-operative housing societies and approved State lending authorities for on-lending to home purchasers. Under the 1984 CSHA the annual interest rate charged by a State to societies and approved lending authorities is to be determined periodically by the Commonwealth and State Ministers with regard to the minimum Commonwealth Savings Bank market rate for housing loans. Eligibility conditions are set by each State, but loans can only be made to those who cannot obtain mortgage finance on the open market, or from other sources. Loan repayments are based on the borrowers' income.

### Rental housing assistance

Funds available to the States for the provision of public rental housing include federal funds, internally generated funds arising from the operation of housing programs, proceeds from the sale of rental housing, and State contributions. Under the 1984 Agreement, each State determines eligibility for rental housing subject only to the condition that all people are eligible for assistance but priority goes to those most in need. As required under the 1984 CSHA, State Housing Authorities have implemented a cost rent formula for setting rents. Cost rents reflect the cost of providing rental housing.

Each State determines its policy on sales of rental dwellings but all sales are to be at market value or replacement cost and on the basis of a cash transaction. Home purchase assistance funds can be used to finance the purchase of rental dwellings.

### Specific purpose programs

In addition to untied assistance used for the provision of home purchase assistance and general public rental housing, the CSHA provides funds for a number of specific purpose programs:

- Rental Assistance for Pensioners.* The numbers of pensioner units provided under this program to 30 June 1986 amounted to around 18,000.
- Rental Assistance for Aboriginals.* Since 1979-80 the Federal Government has provided separately identified funding to the States for rental housing assistance for Aboriginals through the CSHA. Since 1980, 4,217 dwellings have been provided in the six States and the Northern Territory under this program. This includes the upgrading of existing dwellings.
- Mortgage and Rent Relief Scheme.* This is a program for the provision of short term assistance to low-income earners experiencing genuine financial difficulty in meeting their mortgage repayments, rent payments or in gaining access to private rental accommodation.
- Crisis Accommodation Program.* A program introduced to assist families, youths, single men and women in crisis situations, as well as the chronically homeless.

### Local Government and Community Housing Program

In 1984-85, the Commonwealth introduced the Local Government and Community Housing Program. Grants are provided to the States and the Northern Territory to assist local governments, community groups and other non-government organisations to purchase, construct, lease or upgrade dwellings for low cost rental housing. The main objectives of the program are to attract local government and community expertise and money to supplement CSHA efforts, broaden the choice of low cost rental housing and involve tenants in the management of their dwellings. Decisions on the broad program for funding are made by the Commonwealth and State Housing Ministers based on advice from State Advisory Committees. Under arrangements applicable to the operation of the program, States are responsible for the day-to-day administration. Grants under this program are not required to be matched by the States.

## Housing Loans Insurance Corporation

The Housing Loans Insurance Corporation is a government business enterprise which insures lenders (such as building societies, banks, etc.) against loss on housing and building loans.

From November 1965, when the Corporation commenced operations, until the end of June 1986, 760,000 loans to the value of \$22,000 million had been insured.

## Housing Agreement (Service Personnel)

State housing authorities build and upgrade dwellings for allocation to service personnel under the agreed arrangements with the Commonwealth Government. The arrangements to 30 June 1981 are covered by the Commonwealth-State Housing Agreement. Operations have continued since that time under the same arrangements pending a new agreement.

Dwellings no longer required for service personnel revert to State public housing stock and in 1986-87 some 652 dwellings were returned to the States for use as public rental housing.

Following the 1984 Task Force Review on Housing for Service Personnel, the Government announced on 30 January 1986 that it would establish a Defence Housing Authority, operating as a Statutory Authority and responsible to the Minister for Defence.

In 1986-87, \$2.4 million was spent on the provision and upgrading of dwellings.

## Defence Service Homes

The *Defence Service Homes Act 1918* assists certain former and serving members of the Defence Force to acquire a home on concessional terms.

The Defence Service Homes Corporation is, subject to the directions of the Minister for Veterans' Affairs, responsible for the administration of the Defence Service Homes Act.

Persons eligible under the Act include:

- members of the Australian forces and nursing services enlisted or appointed for, or employed on, active service outside Australia or on a ship of war during World War I and World War II;
- persons who served in the warlike operations in Korea or Malaya or on operational service in South East Asia;
- members of the Defence Force who serve on continuous full-time service and national service men whose periods of service ended not earlier than 7 December 1972 and who meet certain prescribed conditions.

The categories of eligible persons also include the widows and, in some circumstances, the widowed mothers of eligible persons, and persons domiciled in Australia and employed in certain sea-going service during World War I and World War II.

During 1984-85 the following loan conditions applied:

|                          |                                                                                                                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Maximum loan:</b>     | \$25,000                                                                                                                                                                                            |
| <b>Interest rates:</b>   | 3.75 per cent per annum on the first \$12,000                                                                                                                                                       |
|                          | 7.25 per cent per annum on any excess over \$12,000 up to \$15,000                                                                                                                                  |
|                          | 10.00 per cent per annum on an amount in excess of \$15,000                                                                                                                                         |
| <b>Repayment period:</b> | The maximum repayment period permitted by the Act is 45 years or, in the case of the widow or widowed mother of an eligible person, 50 years. Normally the repayment period is limited to 32 years. |

On 14 May 1985 the Treasurer announced that persons joining the Defence Force after that date would not qualify for benefits under the Defence Service Homes Scheme; instead, those persons would be eligible for home ownership assistance under a scheme to be developed.

The Treasurer's statement of 14 May 1985 also announced the Government's intention to arrange for private financial institutions to provide loans that would include a substantial interest concession and to administer existing loans. Consistent with this decision institutions were invited, through newspaper advertisements on 12 December 1986, to express interest by 11 March 1987 in providing new loans and managing the existing portfolio of mortgages and the insurance operations. The evaluation of the responses had not been completed at 30 June 1987.

### Operations under the Defence Service Homes Scheme

Since the inception of the Defence Service Homes Scheme in 1919, 426,176 eligible persons have been assisted under the Act. The figures shown include persons originally assisted under housing agreements with the States, and taken over in accordance with those agreements.

The following tables give details of the operations under the Defence Service Homes Act for the years 1981-82 to 1986-87. The figures shown include operations in the Australian Capital Territory, the Northern Territory and Norfolk Island.

#### DEFENCE SERVICE HOMES ACT: NUMBER OF LOANS GRANTED

| Year              | Construction of homes | Purchase of new homes | Purchase of previously occupied homes | Enlargement of existing homes | Total |

(b) Includes Papua New Guinea

(c) Includes Northern Territory

(d) Included in New South Wales.

### State housing authorities

The following paragraphs describe briefly the organisation of the various State housing authorities and their activities in the fields of home construction and provision of homes on a rental basis.

### **New South Wales—Department of Housing**

The Department came into being with the enactment of the *Housing Act 1985* on 1 January 1986, which enabled the amalgamation of the Housing and Land Commissions of New South Wales and various housing related divisions of other departments. The Department's structure reflects a more objective and integrated approach to the provision of secure, appropriate and affordable housing to all sections of the community with housing needs.

Advances from the Commonwealth Government have provided most of the Department's capital funds and by 30 June 1986 had aggregated \$1,318,764,000 of which \$194,984,000 had been repaid. Other net funds of the Department at 30 June 1986 comprised: repayable advances from the State, \$357,800,000; public loans raised by the Department, \$281,478,000; grants from the Commonwealth Government, \$758,646,000; grants from the State, \$81,368,000 (including \$8,668,000 from Consolidated Revenue and \$72,700,000 mainly from the proceeds of poker machine taxes); and accumulated surplus, \$258,273,000. In addition, the Department owed \$68,433,000 to creditors, mainly for purchase of land and work-in-progress. These funds were represented by fixed assets, \$2,841,839,000 (including \$115,291,000 owed by purchasers of homes); and current assets, \$106,091,000. In 1985-86, the Department's income was \$151,360,000 (including rent, \$118,414,000 and interest, \$18,097,000); expenditure was \$146,870,000 (interest, \$52,704,000).

The permanent dwellings provided by the Department have been erected under the Commonwealth-State Housing Agreements or from State loans and grants. In 1985-86, 4,272 houses and flats were completed for the Department by contracted private builders.

Upon request by other State departments, the Department will erect houses for employees of those departments, the departments providing the necessary lands and funds. In addition, the Department erects (with State funds) dwellings for employees of industries connected with decentralisation and development. Specially designed units are erected by the Department to provide dwellings for elderly persons at rentals within their means. The rents of these units, as at 30 June 1986, were approximately \$18.38 a week for elderly single persons and \$30.65 a week for elderly couples. At 30 June 1986, 13,776 units had been completed.

### **Victoria—Ministry of Housing**

The various State housing authorities were consolidated under the control of the Ministry of Housing early in 1983. These authorities included the Housing Commission, the Government Employee Housing Authority and the Co-operative Housing Registry.

The Ministry's key objectives are to:

- facilitate the continuing access of all Victorians to affordable, adequate and appropriate housing;
- deliver housing assistance programs in an effective, efficient and equitable manner.

Thus, the Ministry is not only involved in the provision of public rental accommodation but also in the provision of assistance to private tenants and existing and potential homeowners. The Ministry also co-operates with community groups in the provision of emergency housing, and programs to assist the homeless are currently under development.

During 1986-87 a total of 3,179 public rental units were built or purchased, using funds provided under the Commonwealth-State Housing Agreement, State funds and Ministry funds. The Ministry's public rental stock was 54,000 as at 30 June 1987 of which 64 per cent were located in the metropolitan area. As at 30 June 1987 there was a waiting list of 30,076 households requesting public rental assistance, as well as 4,404 households wishing to transfer from one Ministry unit to another. Tenants on reduced rents (rebates) totalled 40,029 at this date, representing 78 per cent of all tenants.

The Ministry also provides assistance to households renting in the private sector. Under the Bond and Relocation Scheme, the Ministry provides financial assistance to individuals or households in the private rental market by making funds available for security deposits (bonds), rent-in-advance and removal expenses. Individual single applicants may receive a maximum loan of \$500 and families or groups may receive up to \$700. During 1986-87 some 12,702 households received assistance under this scheme, at an average level of assistance of \$543 per household.

### **Queensland—Queensland Housing Commission**

The Queensland Housing Commission was established in 1945 to assist in meeting the housing shortage. In addition, the Commission was empowered to build houses itself, either for sale or for rental.

During 1986-87 the Commission provided 5,507 dwelling units, bringing the total number under all schemes since the revival of housing construction in 1944-45 to 89,009. Of this number, 57,381 houses, or 64.5 per cent, were for home ownership, and 31,628, or 35.5 per cent, were for rental.

In the field of rental housing, the Commission administers, and acts as the constructing authority under, the Commonwealth-State Housing Agreements and States Grants (Housing) legislation. Operating under the provisions of the *State Housing Act 1945-1986*, the Commission, through its scheme of mortgage finance, makes advances for the construction of dwellings to eligible persons who own a suitable building site or to purchase a house and land package. The number of dwellings completed during 1986-87 under this scheme amounted to 3,618, making a total of 55,690 completions since the inception of the scheme. The Commission also has power to make advances, secured by mortgage, to firms for housing of employees. The Commission has power to sell houses under contract of sale conditions. Contract of sale agreements were made to purchase 54 of the Commission's houses during 1986-87.

#### **South Australia—South Australian Housing Trust**

The South Australian Housing Trust was established under the *South Australian Housing Trust Act, 1936*. Under the *Housing Improvement Act, 1940*, the Trust became the housing authority to administer the Act and the Trust's powers were extended. It is also the housing authority for South Australia under the *Housing Assistance Act 1984*.

The primary role of the Trust is to provide housing for those in need, and within their capacity to pay. The Trust aims to provide housing which is appropriate for the householders' needs, is of an acceptable and modern standard and is integrated within the surrounding environment.

The Trust makes housing available to those in need, by the construction, purchase or leasing of property which is let to tenants at rents related to cost, with a rent rebate scheme for those with special needs; by the sale of housing, mainly to sitting tenants.

The Trust also provides assistance to tenants renting privately through:

- the administration of the Rent Relief Scheme;
- its management responsibility for the Emergency Housing Office;
- exercising its responsibilities under the Housing Improvements Act.

It also assists home owners in financial crisis through the Mortgage Relief Scheme.

The Trust is actively involved in providing housing in partnership with other organisations. One example of this is the Housing Co-operatives Scheme under which the Trust subsidises private rental co-operatives. Others include joint ventures with various private, local government and community organisations where resources are pooled, in order to meet local housing needs; and community tenancies where the Trust provides residential accommodation for community purposes including women's shelters and youth housing.

The Trust has a separate responsibility to government to act as the State's industrial property authority, to provide industrial premises for approved additions to or extensions of industrial facilities within the State.

A total of 108,132 dwellings have been built, purchased or leased by the Trust since 1936.

#### **Western Australia—State Housing Commission of Western Australia**

The activities of the State Housing Commission, trading as Homeswest, extend throughout the State. Under the State Housing Act, the Commonwealth-State Housing Agreements prior to 30 June 1971, the *States Grants (Housing) Act 1978*, the 1978 Housing Agreement, the 1981 Housing Agreement, and the 1984 Housing Agreement, the Commission constructs a variety of dwelling types for its rental and purchase programs. In addition, it constructs housing for other government departments (both Commonwealth and State Government, and semi- and local government authorities) and constructs and maintains houses for the Government Employees' Housing Authority.

At 30 June 1987, the Commission had provided under all schemes since 30 June 1944 a total of 78,173 units of accommodation throughout the State (including 12,046 units completed under the *Defence Services Homes Act 1918*).

During the twelve months ended 30 June 1987, 1,999 units of accommodation were provided: 1,164 in the metropolitan area, 443 in country areas and 392 north of the 26th parallel.

Building societies are a major source of housing finance in Western Australia. At 30 June 1987, it was estimated that the assets of permanent and terminating societies were about \$1,880 million. Currently, 7 permanent and 177 terminating societies are operating. Under

the 1984 Housing Agreement with the Commonwealth, the State is required to allocate a proportion of the funds the State receives under the Agreement to the Home Purchase Assistance Account. Advances are made from the account to terminating building societies which in turn make loans available to eligible applicants, being those persons unable to obtain mortgage finance assistance in the open market or from other sources.

Under the *Housing Loans Guarantee Act, 1957-1986*, the guarantees provided to financial institutions enable loans to be made by lending institutions with full security. The Act enables building societies and other approved bodies to make high ratio advances to families of low and moderate means without additional charge. The interest rate charged to the borrower is in line with the Commonwealth Bank mortgage rate. Loans may be made for up to 95 per cent of the value of the house and land. The maximum loan permitted in respect of the metropolitan region south of the 26th parallel is \$50,000. For a new house situated in the country south of the 26th parallel, the maximum loan is \$52,500; for the Kalgoorlie and Esperance region, \$57,000; in the North West and Eastern Division, \$86,000; and in the Kimberley region, \$88,000.

#### Tasmania—Tasmanian Housing Department

The Housing Department is responsible for administering the portion of the *Homes Act 1935* relating to the acquisition and development of land for housing purposes and the erection of homes for rental and sale to those deemed in need of assistance.

During 1986-87, dwelling completions numbered 568. The total number of dwellings constructed to 30 June 1987 was 23,850, of which 7,958 have been paid for in full, sold or demolished. The number of properties purchased numbered 1,424, making a total dwelling stock of 17,316. Of these 12,883 are detached or semi-detached, 2,335 are elderly persons' units, 424 are multi-unit flats, 1,645 are villa units and 29 are moveable units.

Dwellings are allotted on a rental basis, however tenants are able to achieve home ownership through a purchase contract. The weekly rental of a house was between \$45.00 and \$79.00 at 30 June 1987. Approximately 71 per cent of tenants are in receipt of a rental rebate.

### Housing schemes in Australian Territories

#### Northern Territory

In 1946 control of all government-owned residences in the Territory (excluding those belonging to the Defence Services, Commonwealth Railways or attached to post offices) was vested in the Administration. The Northern Territory Housing Commission was established in 1959 and currently operates under authority of the *Housing Act 1982*. In 1968, an amendment to the Housing Ordinance gave the Commission power to build dwellings for approved industries and government departments and authorities. The Commission became autonomous on 1 October 1969.

#### Australian Capital Territory

The Commonwealth Government provides houses, flats and aged persons' units for rental to persons on low incomes who live or are employed in the Australian Capital Territory. At 30 June 1987, the then Department of Territories controlled 7,522 houses and 3,709 flats (including aged persons' units) for rental purposes. Government rental houses are currently not available for purchase by tenants.

### Summary of rental activities of government authorities

### Advances to home purchasers

Many prospective home purchasers wish to borrow for the purpose of constructing or purchasing their own homes. Usually the loan is covered by way of mortgage of the home to be constructed or bought. Such loans are provided from a number of private sources and from agencies owned or guaranteed by the Commonwealth or State Governments. The information in this section concerns the direct loans made to home purchasers by the more important institutional lenders. Loans to institutions which in turn lend moneys to home purchasers and loans to contract builders, etc., are excluded as far as possible. The loans may be for the construction of new dwellings, the purchase of existing dwellings, for additions, renovations, etc., as first or subsequent mortgages, overdrafts and so on. While figures of all loans to home purchasers are not available, the institutions mentioned account for a significant proportion of total loans. Details of the terms and conditions of lending are given, together with available information on the number and value of loans made.

### State and Territory authorities and agencies

#### New South Wales—State Bank of New South Wales—Sale of Homes Agency

The State Bank of New South Wales, by arrangement with the New South Wales Government, administers funds provided in respect of agency schemes under which finance is made available to individuals for erection or purchase of homes and for other approved purposes associated with homes.

Prior to 1976, the Sale of Homes Agency undertook arrangement for the sale on terms of houses erected by the Housing Commission of New South Wales and houses sold on terms under the 1956 and subsequent Commonwealth-State Housing Agreements and Arrangements. The Agency has continued to administer the purchase accounts. For further details on this responsibility of the Bank see *Year Book* No. 66.

The Housing Society Agency administers advances made to co-operative housing societies and the State Bank (as the approved government lending institution of the State) from funds allocated to the State under Commonwealth-State Housing Agreements and Arrangements. Borrowers pay interest on the advances made prior to 1 July 1985 at rates ranging from 5 per cent per annum to rates which increase annually until they are 1 per cent per annum below the then current Commonwealth Savings Bank rate for housing loans. Changes brought about by the *Housing Assistance Act 1984* require borrowers to pay interest at the rate of 11.25 per cent per annum on advances made from 1 July 1985, but for low income earners a rebate of interest is allowed. Repayments by borrowers range from 20 to 30 per cent of income.

Particulars of advances by the Agency during the last six years appear in the following table.

**AGENCY ADVANCES**  
(**\$'000**)

| <i>Year ended 30 June</i> | <i>Advances during year</i> | <i>Total advances to end of year</i> | <i>Principal repaid during year</i> | <i>Advances outstanding at end of year</i> |
|---------------------------|-----------------------------|--------------------------------------|-------------------------------------|--------------------------------------------|
| 1981 . . . . .            | 52,640                      | 668,325                              | 34,733                              | 373,918                                    |
| 1982 . . . . .            | 50,615                      | 718,940                              | 27,702                              | 396,865                                    |

*Stamp Duty Deferred Payment Scheme*

In 1976 the State Government introduced a scheme by which first home buyers may be eligible for a deferment of the amount of stamp duty payable on their first home. The Stamp Duties Office determines, on behalf of the Treasury, the eligibility of applicants and properties and, if acceptable, approves of an advance being made for payment of stamp duty in accordance with the scheme. Applicants repay the advance to the State Bank over a period of five years by equal annual instalments. The advances are free of interest provided instalments are paid by the due date. To 30 June 1986, 182,758 applicants had taken advantage of the Deferred Payment Scheme to the extent of \$154.2 million. Balances outstanding as at 30 June 1986 totalled \$64.9 million in respect of 94,698 accounts.

*State Second Mortgage Loan Scheme*

On 1 July 1981 the New South Wales Government introduced the State Second Mortgage Loan Scheme to provide second mortgages to assist eligible low to moderate income earning families to acquire their home. The interest rate charged is 12 per cent per annum or the notional rate payable on the first mortgage, whichever is the higher, and remains fixed for the term of the loan. The maximum loan is \$15,000 and loans are repayable over 10 years. The scheme is financed from funds made available by various government instrumentalities and is administered by the State Bank of New South Wales. From the inception of the scheme to 30 June 1986, 7,294 loans for \$69.2 million were approved.

**State Bank of New South Wales—other loans**

The State Bank of New South Wales provides assistance to individuals for the erection or purchase of homes and for other approved purposes associated with homes. Advances are based on the bank's official valuation of the dwelling. The rate of interest on new long term loans for housing purposes as at September 1987 was 15.5 per cent per annum.

**Victoria—Ministry of Housing**

Home purchase loans granted totalled 2,255 over 1986–87, of which 572 were provided through the co-operative housing societies. The loans were provided through several schemes: Capital Indexed Loans (CAPIL) — 1,285 loans; Indexed Repayment Loans — 908 loans and Home Ownership for the Over Fifties — 62 loans. Expenditure under these three schemes during the financial year was \$70.2 million, \$52.0 million and \$2.8 million respectively.

CAPIL is the Ministry's standard lending instrument. Repayments are fixed at 25 per cent of an eligible household's income with the interest rate tied to the annual rate of inflation to provide a real rate of return of 3 per cent per annum. In addition to standard CAPIL funding, the Real Estate Agents' Board has provided \$7 million in funds targeted for people aged 50 and over. The new scheme, called Home Ownership for the Over Fifties (HOOF), was launched in June 1986. The third loan type (Indexed Repayment Loan) is a new joint venture between the Ministry and four leading banks. The scheme provides for a two part loan arrangement, with a first mortgage being held by the banks and the second mortgage with the Ministry. The first mortgage is over a fixed 25 year term with a variable interest rate set by the bank. The borrower pays the Ministry repayments set at 25 per cent of income and the Ministry pays the full instalment to the bank. The shortfall on the repayments made to the Ministry are secured under the second mortgage with an interest rate geared to the Consumer Price Index. When the first mortgage is paid out, repayments continue until the Ministry's second mortgage is discharged.

**Queensland—Queensland Housing Commission**

Loans from the Commonwealth and State Governments are the major source of capital funds for the Commission. Under the *State Housing Act 1945-86*, an eligible person who is the owner of a suitable building site may obtain an advance, secured by mortgage on the land, from the Housing Commission for the erection of a dwelling. The Housing Commission also provides mortgage finance for the purchase of homes already built or to be built by private contractors. The Commission has three home ownership schemes. The first, the Interest Subsidy Scheme, provides a non-repayable subsidy to borrowers who cannot afford commercial rates of interest. The Commercial Scheme is for those on higher incomes who cannot obtain finance elsewhere, and the Second Loan Scheme, introduced in 1984, assists borrowers to bridge the deposit gap. To be eligible, a borrower must qualify for the Interest Subsidy Scheme.

**South Australia—South Australia Housing Trust**

The Trust also administers the Rental Purchase Scheme in conjunction with the State Bank. This scheme supersedes the Low Deposit Purchase Scheme in assisting low income people in purchasing a home through a nominal deposit and low interest loan.

In September 1986, the Trust initiated the HOME Trust Shared Ownership Scheme whereby tenants can purchase their home in affordable stages commencing with a 25 per cent share.

**Western Australia—State Housing Commission of Western Australia**

In December 1984 the Commission introduced new loan initiatives to assist applicants with home ownership. These schemes are known as First Mortgage, Flexible Deposit, Shared Equity and Senior Citizens Loan Schemes. The maximum interest rate is maintained in relationship with the Commonwealth Bank interest mortgage rate and the repayment of the loan is on an income geared basis with an applicant not being expected to pay more than 25 per cent of assessed family income in repayments. The maximum repayment period is 30 years.

Under the schemes, the applicants are able to select an established home or build a new home of their choice. The maximum income limits vary with the location. A family with one child can have a maximum weekly income of \$384.30 in the metropolitan area, \$497.30 in remote areas and \$542.50 in the Kimberley region. These limits increase by \$10 for each additional child after the first.

Under the First Mortgage, Flexible Deposit and Shared Equity Schemes, the maximum value of house and land in the metropolitan area is \$41,500 if buying an established home or \$43,000 if building a new home. In non-metropolitan areas, the maximum value varies from \$43,500 for an established house in country areas to \$80,000 if building a new home in the Kimberley region. Minimum deposit required is usually 5 per cent of valuation, although with the Flexible Deposit Scheme as little as \$500 can be paid as the deposit on a home.

The Shared Equity Scheme was designed to help people on very low incomes into home ownership. Homeswest purchases the home on behalf of the applicant and funds the applicant to an equity share of not less than 60 per cent of the home value. Normally 5 per cent of the loan sought is required for the deposit but this can be reduced to as little as \$500. All maintenance, insurance and rates are shared in accordance with the applicants' equity share.

Assistance through Terminating Building Societies is available to eligible applicants from the Loans Priority List under first mortgage conditions. Funds are not available for second mortgages. The interest rate on advances is up to 13.5 per cent depending on family income and the maximum term is for 30 years. In the metropolitan area, the maximum income limit is \$384.30 per week plus an extra \$5 per week for each dependent child after the first. The value of house and land cannot exceed \$43,500 and a 5 to 10 per cent deposit is required. In other areas around the State, maximum income limits vary between \$384.30 in country areas and \$542.50 in the Kimberley region and the maximum value of house and land varies from \$47,000 in country areas to \$84,000 in the Kimberley region.

See Savings Banks, page 243 of *Year Book* No. 61, for activities of the Savings Bank Division of the Rural and Industries Bank of Western Australia.

**Tasmania—Tasmanian Housing Department**

The home purchase scheme, to enable low income earners to achieve home ownership, is based on a purchase contract with repayments being fixed at 25 per cent of the purchaser's

income; interest payments are deferred where the tenant's income is insufficient to meet all the interest repayments.

During 1986-87, 192 homes were sold under purchase contract.

#### Tasmanian Development Authority

The Authority is responsible for the administration of funds made under the Home Purchase Assistance section of the *Housing Assistance Act 1984*. The State has also provided State loan funds for lending under the Homes Act.

The primary principle of the *Housing Assistance Act 1984* is to ensure that every person in Australia has access to adequate and appropriate housing at a price within his or her capacity to pay.

The Authority has introduced a Deferred Interest Subsidy Scheme, whereby low income earners can borrow sufficient amounts to enable them to purchase a reasonable dwelling. The current rate of interest is 13.5 per cent with monthly repayments based on 25 per cent of joint gross monthly income. When the repayment is not sufficient to meet the interest charged on the loan, the balance is deferred and repaid in the later years of the loan. There is no interest charged on the deferred proportion of the loan.

The Authority has recently introduced a new Home Ownership Building Industry Scheme (HOBIS) whereby private builders were requested to tender for the construction of 104 homes throughout the State for low to moderate income earners who could not otherwise afford to purchase a new home. As an incentive, loans were offered at an initial interest rate of 10 per cent, increasing by 1 per cent per annum until the normal rate for housing loans with the Authority is reached.

(a) Excludes advances to co-operative housing societies.

#### Northern Territory—Loans Scheme

The Northern Territory Government Home Loan Scheme, introduced on 1 October 1979, was replaced on 1 September 1984 by the *Northern Territory Home Purchase Assistance Scheme*. This scheme is based on the principles set out in the Commonwealth-State Housing Agreement.

The scheme is based on a maximum loan of \$50,000 to lower income groups. As the gross weekly income of the highest earner increases, the amount of the Commission loan decreases. There is a requirement that a prescribed amount be borrowed from a private lending institution for the higher income group.

Repayments on the loan are based on 20 per cent of gross family income and reviewed annually. Where the repayment is insufficient to cover interest due, the unpaid amount is allowed to accumulate free of additional charges.

The interest rate currently charged is 13.5 per cent and the Commonwealth Savings Bank Home Loan rate will be an indicator for future interest rates. The maximum term of the loan is 45 years.

To be eligible to apply, applicants must not own a home elsewhere in Australia, have resided in the Territory for the six months prior to application and property value must not exceed \$100,000. Loans can be on a first or second mortgage basis.

#### Northern Territory—Sales Scheme

A scheme exists to allow eligible tenants of the Northern Territory Housing Commission dwellings to purchase dwellings under the General Public Sales Scheme. Sales are on a cash basis only to approved tenants.

#### Australian Capital Territory

The Commissioner for Housing operates an income-g geared loan scheme to assist people who are generally unable to afford finance in the private market. Loans to a maximum of \$60,000 over a maximum term of 30 years are available for the purchase or erection of

dwellings in the Australian Capital Territory. The exact amount of loan granted and term of the loan are determined by the applicants' level of income and assets and the value of the property to be purchased. To qualify for a loan an applicant must:

- be a permanent resident of Australia and have lived or worked in the Australian Capital Territory for at least six months prior to loan approval;
- have attained the age of 18 years;
- not exceeded the applicable income limit which is reviewed quarterly;
- be unable to obtain sufficient housing finance from private sources;
- not have any interest whatsoever in real property located in the Australian Capital Territory or Queanbeyan other than the dwelling or the land upon which it is proposed to erect the dwelling;
- undertake to dispose of any other real property within a period of six months after assistance is granted under this scheme;
- not previously have received government financial assistance in the form of a loan for the purchase or construction of a dwelling in the Australian Capital Territory or Queanbeyan;
- demonstrate a capacity to afford the initial and subsequent commitments for purchase of a property;

The loan must not exceed the determined value limit of the dwelling.

Applicants who do not satisfy one or more of the above conditions may still be granted assistance if, in the opinion of the Commissioner for Housing, the applicant is in need of assistance and the objective of the scheme would be satisfied by providing that assistance. Interest rates for new loans are aligned with the Commonwealth Savings Bank new home loans rate. Instalment repayments are geared to the applicant committing 25 per cent of income to total mortgage payments and instalment subsidies are repaid over the term of the loan or upon discharge. At 30 June 1987, 8,573 properties were under mortgage to the Commissioner for Housing. The Commissioner also administers 6,046 Commonwealth of Australia mortgages.

## CONSTRUCTION

### Building

Building activity is a significant indicator of the level of economic activity. In addition, the level of building activity and the types of buildings being constructed affect the Australian physical and social environment. Building approvals statistics give an indication of the potential future level of investment of private individuals, companies and government agencies in approved building construction. Building activity statistics show the level of actual building construction activity in terms of the level of commencements and completions, building jobs under construction and the value of work done and yet to be done on building jobs.

From July 1985, there was a change in terminology used by the ABS in presenting building statistics. The terms 'residential buildings' and 'non-residential building' replaced 'dwellings' and 'other building' respectively and 'other residential buildings' replaced 'other dwellings'. It should be noted that these were only changes in terminology and do not affect the classification of the various types of buildings or the statistics. The concept of a 'dwelling unit' remained unchanged.

The building statistical collections cover all new residential building of any value, new non-residential building jobs valued at \$10,000 and over, and alterations and additions (to both residential and non-residential building) valued at \$10,000 and over. From 1966-67 to 1972-73, alterations and additions of \$10,000 and over were included with new residential building and new non-residential building. From 1973-74, alterations and additions (of \$10,000 and over) to new residential building are shown separately, but for non-residential building, new work and alterations and additions continue to be shown combined.

From the September quarter 1980 a new Building Activity Survey replaced the previous quarterly Building Operations Census. The major features of the new survey are as follows:

- replacement of the previous complete enumeration of private sector jobs involving new house construction or alterations and additions valued at \$10,000 or more to houses by a sample survey;
- a complete enumeration of jobs involving construction of new residential buildings other than private sector houses, all alterations and additions to residential buildings (other than private sector houses) with an approval value of \$10,000 or more, and all non-residential building jobs with an approval value of \$30,000 or more.

From the September quarter 1981 two additional changes were introduced:

- a one-month-lagged framework of approvals is now used as the basis for selection of both house and non-house building jobs (previously only private sector house jobs were selected from a one-month-lagged approvals framework);
- in general, a building job is now considered to have commenced, for the purposes of the statistical collection, only when the value of work done on that job as reported by the builder is equal to or greater than a pre-determined (threshold) value.

### Number of new houses

The following table provides a summary of the number of new houses approved, commenced, under construction and completed by type of ownership in each State and Territory for the year 1986-87.

#### NUMBER OF NEW HOUSES, 1986-87

#### NEW HOUSES, AUSTRALIA

Note: Break in series from 1980-81 and 1981-82.

### Number of new houses approved, by material of outer walls

The use of certain materials for outer walls is dictated by such factors as cost, durability, appearance and climatic conditions. Changes in the materials used over time indicate changes in the characteristics of the housing stock.

The following table shows the number of new houses approved in each State and Territory during the year 1986-87, classified according to the material of their outer walls.

NUMBER OF NEW HOUSES APPROVED BY MATERIAL OF OUTER WALLS, 1986-87 ('000)

(a) Includes houses constructed with outer walls of stone or concrete.

### DWELLING UNITS IN NEW OTHER RESIDENTIAL BUILDING, AUSTRALIA

Note: Break in series from 1980-81 and 1981-82.

### Number of dwelling units in new other residential building

The level of other residential building construction is highly variable and does not follow the regular pattern experienced in house construction. This can be explained partly by the generally larger size of other residential building construction jobs and also by the extent of speculative building of private flats, home units and similar other residential building projects. Although construction of government-owned other residential buildings is substantial, the proportion of government-owned other residential buildings to total other residential buildings constructed is smaller than that of government-owned houses to total houses.

The following table shows the number of new dwelling units in other residential building approved, commenced, under construction and completed by type of ownership in each State and Territory for the year 1986-87.

**Value of buildings**

The following table shows the value of all buildings approved, commenced, under construction, completed, work done and work yet to be done in Australia for the year 1986-87, according to the class of building. The classification of non-residential building by type of building is according to the function a building is intended to serve, as specified on building authorisations.

**Constant prices**

Estimates of the value of work done at average 1979-80 prices are presented in the following table. Constant price estimates measure changes in value after the direct effects of price changes have been eliminated.

**VALUE OF BUILDING WORK DONE AT AVERAGE 1979-80 PRICES, AUSTRALIA**  
(**\$ million**)

| Year          | New residential building |                             |         | Alterations and additions to residential buildings | Non-residential building | Total building |
|---------------|--------------------------|-----------------------------|---------|----------------------------------------------------|--------------------------|----------------|
|               | Houses                   | Other residential buildings | Total   |                                                    |                          |                |

### Building research activity

The CSIRO Division of Building Research (amalgamated with the Division of Energy Technology) is the main, and largest, centre of building research in Australia, with a total staff of some 260, about 110 of whom have professional qualifications through all the conventional sciences, social sciences and economics. The work of the Division covers all aspects of building design, maintenance, construction, and planning.

The work is carried on in four programs, namely: Design for Durability, Life Cycle Performance, Safety & Risk, and Shelter & Infrastructure. The Division has been in existence for over 40 years, and the nature of its work has changed considerably with time. Two main themes dominate the existing programs:

- information technology;
- deterioration and restoration of the infrastructure.

For further details, see *Year Book* No. 70.

### Engineering Construction Survey

This section contains estimates of engineering construction activity in Australia by both public and private sector organisations and are the first estimates of total engineering construction produced by the ABS.

These estimates together with results from the Bureau's Building Activity Surveys provide a complete picture of building and construction activity in Australia for the first time.

The estimates of engineering construction activity by the private sector were compiled from the Construction Other Than Building (COTB) Survey and the new Engineering Construction Survey (ECS), which has replaced the COTB Survey from the September quarter 1986. The estimates for engineering construction activity by the public sector, which were compiled from the ECS Public sector units, were not in the scope of the COTB Survey.

The collection methodology for the ECS is different from the COTB Survey and caution should therefore be exercised when interpreting the time series derived from the two surveys.

### Scope and coverage of the surveys

The ECS aims to measure the value of all engineering construction work undertaken in Australia whereas the COTB Survey only measured such work undertaken by the private sector. For the ECS, all enterprises recorded on the ABS central register of economic units and classified to the construction industry and all other units known to be undertaking engineering construction work (from trade journals, newspapers, etc.), were included in the survey framework. For the COTB Survey the framework was all known engineering construction prime contracts with a value greater than \$100,000.

The cost of land and the value of building construction is excluded from the survey's scope. Where projects include elements of both building and engineering construction, for example, electricity generation and heavy industrial plant, every effort is taken to exclude the building component from these statistics.

Repair and maintenance activity is excluded from the survey as are the value of any transfers of existing assets, the value of installed machinery and equipment not integral to the structure and the expenses for relocation of utility services.

A contract for the installation of machinery and equipment, which is an integral part of a construction project, is included in the statistics even though, in some cases, the activity in installing such machinery and equipment is classified to the manufacturing industry in the *Australian Standard Industrial Classification, Volume 1* (1201.0).

### Comparison of the Engineering Construction Survey (ECS) and the Construction (Other Than Building) (COTB) Survey

The main differences between the COTB Survey and ECS are as follows:

- Construction undertaken by public sector organisations is included in the ECS but not in the COTB Survey.
- Speculative and own account work undertaken by the private sector is included in the ECS but not in the COTB Survey.
- Prime contracts undertaken by the private sector and valued at less than \$100,000 are within the scope of the ECS but not the COTB Survey.
- The statistical unit for the ECS is the enterprise which is defined as a unit covering all the operations in Australia of a single operating legal entity. Each collection unit is required to report details of its operations in each State.
- The statistical unit for the COTB Survey was any construction prime contract valued at \$100,000 or more and undertaken by a private sector prime contractor.
- The categories of construction differ as follows:
  - (i) The 'heavy industrial plant and equipment, n.e.i.' category in the COTB Survey has been divided into 'oil, gas, coal and other minerals'; 'other heavy industry' for the ECS.
  - (ii) A new ECS category has been defined called 'recreation' and includes golf courses, playing fields, racecourses, stadiums, swimming pools, velodromes, landscaping, park construction etc.
- The treatment of machinery and equipment in engineering construction is particularly difficult. The value of machinery and equipment that is integral to the structure should be included as should the cost of on-site erection of heavy machinery. All other machinery and equipment should be excluded. In ECS, this aspect has been brought to the attention of respondents whereas, in the COTB Survey, limited investigations showed that some machinery and equipment values were reported in construction prime contracts.
- Coding of 'ownership' and 'type of construction' is undertaken by the respondent in ECS whereas in the COTB Survey the Australian Bureau of Statistics carried out this coding based on information supplied.

The following tables show the value of engineering construction (ECS) activity by the private sector for sector of ownership and by the public sector for the year 1986-87.

#### VALUE OF ENGINEERING CONSTRUCTION ACTIVITY BY THE PUBLIC SECTOR 1986-87 (\$ million)

|                                                                 | <i>Commenced</i> | <i>Work done (a)</i> | <i>Work yet to be done (b)</i> |
|-----------------------------------------------------------------|------------------|----------------------|--------------------------------|

(a) At end of period. (b) During period. (c) Comprises bridges, railways, pipelines, street and highway lighting, telecommunications and miscellaneous.

## Construction Industry Survey

This section contains statistics obtained from a sample survey of private sector construction establishments and of public sector enterprises engaged in construction and repair and maintenance activities, conducted in respect of 1984-85. The previous Construction Industry Survey was conducted in respect of 1978-79. For further details see *Year Book* No. 70.

The private sector collection was conducted as a component of the Bureau's integrated economic statistics program. This program has been developed so that data from each industry sector conform to the same basic conceptual standards, thereby allowing comparative analysis across different industry sectors. The results of this survey are therefore comparable with economic censuses undertaken annually for the mining, and electricity and gas industries and periodically for the transport, manufacturing, wholesale, retail and selected service industries.

### Private sector construction industry statistics

The collection provided detailed information on employment, wages, operating expenses, turnover, value added, capital expenditure, as well as on the structure and size of establishments in the construction industry. The following tables show, for private sector construction establishments, selected items of data by industry class and statistics on the value of work undertaken by broad commodity groups. Further statistics are contained in the publications: *Private Sector Construction Establishments, Details of Operations, States and Territories, 1984-85* (8772.0-8772.8)

(a) To all types of buildings and structures.

### Public sector construction activity statistics

The Public Sector Construction Activity Survey provided details on the construction and maintenance activities of all public sector enterprises engaged in managing or undertaking construction and maintenance activity using their own employees or a combination of their own employees and contractors. Details such as expenses, payments to contractors and employment associated with new construction and major alterations and additions, and total expenses and employment associated with road and other maintenance activities was provided. No details are available for public sector enterprises which contracted out all construction and maintenance work.

Because of the different concepts used in the collection of these data, the public sector results cannot be validly aggregated with those for the private sector.

The following table shows expenditure of public sector enterprises by activity and level of government. Further statistics are contained in the publication: *Public Sector Construction Activity Survey, 1984-85* (8775.0).

# TRANSPORT AND COMMUNICATIONS

---

This chapter contains information on transport and communications and the government bodies concerned with these activities. More detailed figures and particulars for earlier years are included in the publications listed in the bibliography at the end of the chapter. Two special articles have been included in this chapter, and can be found on pages 772 and 775.

## TRANSPORT ORGANISATIONS

### The Australian Transport Advisory Council—ATAC

In April 1946, Commonwealth and State Governments agreed to establish a co-ordinating and advisory council at Ministerial level with the principal function of reviewing annually the various laws and regulations deemed necessary to safeguard the interests of the State governments and road users generally, and to consider matters of transport policy. The Australian Transport Advisory Council comprises Federal, State and Territory Ministers responsible for transport, roads and marine matters. The New Zealand Minister of Transport is also represented on the Council as an observer.

At present, ATAC meets twice each year and its primary role is to review and co-ordinate various aspects of transport policy, development and administration. ATAC functions through initiating discussion and reports on any matter raised by Council members, and by providing advice on matters which will promote better co-ordination and development of transport to the benefit of Australia. ATAC has one policy advisory group reporting directly to it, the Standing Committee on Transport (SCOT). SCOT comprises a representative of each ATAC Minister, usually the Heads of the relevant departments, and deals with overall issues of policy co-ordination and development. SCOT is supported by four groups of specialist advisers covering the interests of road, rail, road safety and marine and ports.

In addition, the following technical committees and subsidiary bodies report to the Marine and Ports Group and the Road Safety Group:

- Ship Standards Advisory Committee
- Marine Pollution Advisory Committee
- Advisory Committee on Promotion and Education for Road Safety
- Road User and Trauma Advisory Committee
- Advisory Committee on Transport of Dangerous Goods
- Vehicle Standards Advisory Committee
- Advisory Committee on Vehicle Emissions and Noise
- Advisory Panel on Recall and Unsafe Parts
- Data Working Group
- Australian Motor Vehicle Certification Board.

### Transport Industries Advisory Council—TIAC

The Transport Industries Advisory Council was formed following the March 1971 Australian Transportation Conference. The Council advises the Commonwealth Minister for Transport and Communications on national transport issues.

The members of TIAC are drawn from senior management of authorities representing all modes of transport, including user groups, government bodies and unions. The Minister appoints members on the basis of personal expertise and the contribution they may be able to make to Council affairs. The full Council, which meets three times a year, operates through an Executive Committee and subject-specific Project Committees. A report of TIAC activities is published annually in the Department of Transport and Communications Annual Report.

### **Australian Road Transport Advisory Committee—ARTAC**

The Australian Road Transport Advisory Committee comprises representatives of all sectors of the road freight industry and others with relevant specialist expertise. This Committee provides a specific channel of road freight industry advice to the Commonwealth Minister. Membership of ARTAC is drawn from TIAC.

### **Aviation Industry Advisory Council—AVIAC**

AVIAC was established in 1978 to enhance the level of consultation between the aviation industry and the government. The Council provides advice to the Commonwealth Minister for Transport and Communications on policies, plans and programs relating to the aviation industry within Australia, promotes the continuing development of a safe, efficient, economic aviation industry, and provides a forum for discussion of important matters of joint concern to the aviation industry and government.

Membership of the Council consists of the Commonwealth Minister for Transport and Communications (Chairman); Secretary to the Department of Transport and Communications; Chairman of Qantas Airways Ltd; Chairman of Australian National Airlines Commission (Australian Airlines); Chairman of Regional Airlines Association of Australia Ltd; Chairman of East-West Airlines; National Chairman of the General Aviation Association; Joint Chairman of Ansett Transport Industries Ltd; National President of the Royal Federation of Aero Clubs of Australia and President of the Aircraft Owners and Pilots Association of Australia.

AVIAC has established a Committee of Advisers to assist in the analysis and preparation of matters to put to the Council for deliberation and decision.

### **The Federal Bureau of Transport Economics—BTE**

The Federal Bureau of Transport Economics is a professional research body which undertakes independent studies and investigations to assist the Commonwealth Government in formulating policy relating to all modes of transport.

The primary function of the BTE is to advise the Commonwealth Government on the economic, financial and technical aspects of air, road, rail and sea transport in Australia. In pursuit of this overall function, the BTE analyses the nature, capacity, performance and finance of transport systems. It also investigates the economic and resource allocation implications of such systems. The BTE has a secondary function of providing assistance to State and local governments, Commonwealth and State instrumentalities and the private sector to identify and address transport problems.

Although formally linked to the Federal Department of Transport and Communications, the BTE has a considerable degree of professional and administrative autonomy and reports directly to the Minister for Transport and Communications on its program of research work.

### **Independent Air Fares Committee**

The Independent Air Fares Committee was established by the *Independent Air Fares Committee Act 1981*, with the responsibility for approving all passenger fares charged on domestic air services by trunk route, regional and commuter operators. The Act, which is part of the 'two-airline policy' legislation, came into operation in January 1982. The Committee's role is that of a fare determining authority.

Operators may request the Committee to conduct a review to determine the economy air fares to be charged. The Committee approves discount air fares on application from operators where it is satisfied that a proposal meets criteria specified in the Act. Details of economy and discount fares approved by the Committee are notified in the *Commonwealth of Australia Gazette*.

At the request of the Minister for Transport and Communications, the Committee undertakes cost allocation reviews to determine how costs attributable to domestic passenger air services should be allocated between flagfall and distance components of air fares. Public hearings and submissions form part of a cost allocation review during which the principles of fare setting are examined.

## THE TRANSPORT INDUSTRY

### Transport Industry Survey

This section contains statistics obtained from a survey of transport establishments conducted in respect of 1983-84 (referred to as the Transport Industry Survey). This survey was the first of its kind conducted in Australia and included establishments predominantly engaged in providing passenger or freight transport services for hire or reward by road, rail, water and air transport (collectively referred to as the modal transport industries) plus freight forwarding.

The survey was conducted as a component of the Australian Bureau of Statistics' integrated economic statistics system and the results are comparable with economic censuses and surveys undertaken annually for the mining, manufacturing and gas industries and periodically for the wholesale, retail and selected service industries.

#### Summary of operations

The following table shows key items of data by industry mode for transport establishments in Australia, for the year 1983-84. The industries described are based on the 1983 edition of the *Australian Standard Industrial Classification (ASIC)*.

(a) Includes working proprietors and partners.

(b) Excludes the drawings of working proprietors and partners.

### Business Vehicle Survey

Concurrent with the Transport Industry Survey (TIS), the Bureau conducted a Business Vehicle Survey (BVS) to obtain a more complete picture of road freight transport activity in Australia. This involved the collection of road freight transport information from a sample of private enterprises whose main activity was not road freight transport but who operated at least one truck with a gross vehicle mass of 2.7 tonnes or more and used that truck to carry freight on public roads.

Results from the TIS and BVS were combined to produce estimates of road freight activity as shown in the following table.

**ROAD FREIGHT ACTIVITY OF PRIVATE ENTERPRISES: SUMMARY OF ACTIVITY BY  
INDUSTRY DIVISION, AUSTRALIA, 1983-84**

|              | <b>Total . . . . .</b>                                    | <b>164,081</b>                            | <b>227,988</b>                     | <b>39,174</b> | <b>267,161</b> | <b>47,769</b>                       | <b>75,999</b> | <b>123,768</b> | <b>1,325.5</b>                                          | <b>606.9</b>                              |

(a) Excludes the drawings of working proprietors and partners. (b) Estimates of freight carried relate to freight uplifted by trucks and therefore, to the extent that transshipment occurs (i.e. the transfer of freight from one truck to another), estimates of freight carried will overstate the actual physical quantity of freight moved.

NOTE: Road freight activity data collected from road freight establishments included in the TIS has been tabulated against the industry to which the enterprise of the road freight transport establishment is classified, e.g. the figures for a road freight establishment of a manufacturing enterprise would be tabulated against ASIC Division C.

## SHIPPING

### Control of shipping

#### Commonwealth Government navigation and shipping legislation

Commonwealth Acts concerned with shipping are: the *Navigation Act 1912*, the *Sea-Carriage of Goods Act 1924*, the *Seamen's Compensation Act 1911*, the *Seamen's War Pensions and Allowances Act 1940*, the *Protection of the Sea (Discharge of Oil from Ships) Act 1981*, the *Protection of the Sea (Civil Liability) Act 1981*, the *Protection of the Sea (Powers of Intervention) Act 1981*, the *Protection of the Sea (Shipping Levy) Act 1981*, the *Protection of the Sea (Shipping Levy Collection) Act 1981*, the *Protection of the Sea (Prevention of Pollution from Ships) Act 1983*, the *Protection of the Sea Legislation Amendment Act 1986*, the *Australian Shipping Commission Act 1956*, the *Environment Protection (Sea Dumping) Act 1981*, the *Submarine Cables and Pipelines Protection Act 1963*, the *Lighthouses Act 1911*, the *Explosives Act 1961*, the *King Island Shipping Service Agreement Act 1974*, the *Bass Strait Sea Passenger Service Agreement Act 1984*, the *Ship Construction Bounty Act 1975*, the *Australian Shipping Commission (Additional Capital) Act 1985*, the *Ships (Capital Grants) Act 1987*, the *Trade Practices Act 1974 Part X*, the *Shipping Registration Act 1981*.

#### Navigation Act

The *Navigation Act 1912 as Amended*, provides for various regulatory controls over ships and their crews, passengers and cargoes, mainly for the preservation of life and property at sea. Substantial penalties are provided for serious offences. The Act gives effect to a number of important international conventions produced under the aegis of the International Maritime Organisation (IMO).

There are 25 sets of Regulations under the Act, and a system of Marine Orders which give legislative effect to various safety and technical requirements in respect of ships, their cargoes and persons on board.

Taken in the order in which they appear in the Act, the main substantive matters dealt with are as outlined below.

**Masters and seamen**

Some sections deal with the examination of masters, mates and engineers for certificates of competency. Other sections ensure that appropriate conditions apply to crews serving on ships by providing for the supervision of the engagement, discharge and payment of wages; discipline at sea; the settlement of wages and other disputes; the return to their home port of distressed seamen; taking charge of wages and effects of deceased seamen and of those who have deserted or been left behind; and inquiries into deaths at sea. These matters are administered by Mercantile Marine Offices established at numerous ports. The health of seamen is cared for by the prescription of scales of medicines and medical stores to be carried by ships, and there are provisions to give effect to International Labour Organisation Convention requirements for the accommodation of crews. Plans for new or altered accommodation in ships have to be approved by a Crew Accommodation Committee.

There are requirements for the manning of ships and manning disputes are often dealt with by statutory Committees of Advice. The Act provides for a Marine Council to advise the Minister on the suitability of persons for engagement as seamen.

**Ships and shipping**

There are particularly important provisions dealing with ship safety in such matters as survey of ships, load lines, life-saving and fire appliances, prevention of collisions, and carriage of potentially dangerous cargoes. While in Australia, all ships which trade interstate or overseas come under the survey provisions of the Navigation Act and require certificates issued by the Department of Transport and Communications, unless they are registered in a country which is a party to the Convention concerned and hold valid certificates issued by their governments and conforming to the requirements of the Safety of Life at Sea and Load Lines Conventions. There is power to detain any ship, the condition of which does not conform with the conditions set out in its certificate or which appears to be overloaded or otherwise unseaworthy.

**Passengers**

These provisions deal with matters necessary or convenient for regulating the carriage of passengers in respect of such matters as numbers that may be carried, accommodation and health aspects.

**Offshore industry**

These provisions deal with offshore industry vessels and offshore industry mobile units. Marine Orders giving effect to IMO resolutions on this sector of the marine industry were recently introduced.

**Coasting trade**

Under the coasting trade provisions of the Navigation Act, the Australian coastal trade is reserved for licensed vessels, i.e. those which employ seamen at Australian wage rates. The Act does not restrict the class of ships which may obtain a licence. It is open to any vessel, irrespective of the registry, to obtain a licence on compliance with this condition and to operate in the Australian coastal trade, subject to permission being given for the importation of the vessel under the Customs (Prohibited Imports) Regulations where necessary. Provision exists for unlicensed vessels to operate in the coasting trade under single voyage permits in certain circumstances where licensed vessels are not available or are inadequate to meet the needs of the trade. Strict control is exercised over the issue of permits for the carriage of coastal cargoes.

**Wrecks and salvage**

There are provisions in relation to wrecks and salvage, covering preservation of life and of the wreck and its cargo and related matters.

**Limitation and exclusion of shipowners' liability**

These sections give effect to an international convention and make provision on the widest possible basis for the limitation of shipowners' liability in Australia.

**Courts of Marine Inquiry**

There are provisions for the holding of Courts of Marine Inquiry to investigate the circumstances attending any casualties to ships that come within Commonwealth legislative authority, usually following a preliminary investigation.

## Shipping Registration Act

The *Shipping Registration Act 1981* received Royal Assent on 25 March 1981 and was proclaimed on 26 January 1982. This Act replaces Part I of the *U.K. Merchant Shipping Act 1894* under which ships in Australia were registered as British ships. The Act provides for all ships on the British Register in Australia to be automatically transferred to the new Australian Register. The Act has two basic objectives, namely the conferring of Australian nationality on Australian-owned ships and the registration of ownership and encumbrances.

The Act was amended in 1985 to improve the general administration and the protection of registered and unregistered interests.

Taken in order in which they appear in the Act, the main substantive matters are as follows.

### Registration of ships

This part deals with the obligation to register Australian-owned ships, the ships permitted to be registered, the application for registration, particulars to be entered in the Register, the issue of Registration Certificates, Provisional Registration Certificates and Temporary Passes, changes in ownership, marking and naming of the ship, nationality of ships, flags to be flown, assuming and concealing Australian nationality.

### Transfers, transmissions and mortgages

This part deals with the transfer, transmission of ship and shares, the taking out, transfer, transmission and discharge of mortgages and the entry of this information into the Register. Caveats can be lodged to protect unregistered interests.

### Administration

This part deals with the appointment of the Registrar, delegation of the powers of the Minister and Registrar, the establishment of the Shipping Registration Office and Branch Offices.

### Register of ships

This part deals with the maintenance, rectification and inspection of the Register.

### Transitional provisions

This part deals with the change over from the previous law to the new legislation. This includes the completion of transactions commenced under the previous law and the acceptability of documents prepared under the previous law. This part is now largely non-operative.

## Ships (Capital Grants) Act

The *Ships (Capital Grants) Act 1987* provides shipowners with a taxable grant of 7 per cent of the purchase price of eligible new, or newly-acquired second-hand trading ships. The legislation defines the conditions and procedures under which a grant may be paid. Briefly, the Act requires that ships hold a category certificate and be crewed in accordance with crewing benchmarks specified for that category, be registered in Australia and crewed with Australian residents. If newly-acquired second-hand tonnage, the ship concerned must not have been registered in Australia before, and be no more than five years old. The grant scheme is applicable only to vessels ordered after 22 December 1986 and which commence operations between 1 July 1987 and 30 June 1992 for new ships, or 30 June 1990 for second-hand ships.

## Australian Shipping Commission

The Australian Coastal Shipping Commission was established by the *Australian Coastal Shipping Commission Act 1956*. Its role has been to establish, maintain and operate interstate, overseas and territorial shipping services. In October 1974, the Commission's title was changed to the Australian Shipping Commission to reflect the increasing importance of its overseas trading activities. In 1980 the Australian Shipping Commission Act was amended to increase the Commission's borrowing powers and give it greater flexibility in determining freight rates. Further amendments to the Act were introduced in 1983, giving the Commission greater control over its day-to-day operations and allowing it to operate more commercially.

As at 30 June 1987 the Commission, trading as the Australian National Line (ANL), owned and operated a fleet of seventeen ships. The fleet included twelve ships engaged in overseas trades comprising seven liner ships totalling 181,000 deadweight tonnes, and five bulk carriers totalling 334,000 deadweight tonnes.

The fleet also included five ships engaged in coastal trade, two liner ships totalling 15,000 deadweight tonnes and three bulk carriers totalling 185,000 deadweight tonnes. A further vessel was laid up.

The Line operated specialised terminals at Adelaide, Melbourne, Burnie, Bell Bay, Sydney and Brisbane.

In recent times the Line has been affected by the general downturn experienced by the shipping industry, particularly in international trade. In 1984 it initiated a review of all its services. It instituted a major rationalisation and withdrew from unprofitable services which resulted in the disposal of obsolete vessels. In an effort to broaden its revenue base and provide a more integrated transport service, ANL has moved into shipping related activities, particularly container management, ship agency and ship management services.

### **Shipbuilding assistance**

The shipbuilding industry has been assisted by the government since the introduction of the shipbuilding subsidy scheme in 1947.

Ships built at major yards include small cargo ships, offshore supply ships, passenger ferries, fishing ships, dredges and barges. In addition, there are numerous smaller yards building non-bountiable ships such as pleasure craft, small fishing ships, and other small craft. Construction of large ships in Australia ceased in 1978.

Under the *Bounty (Ships) Act 1980*, bounty is accorded to the production in Australia of vessels over 150 gross construction tons, or over 21 metres in the case of fishing ships. Bounty is payable on a 'cost of construction basis' at a rate of 20 per cent.

The report of the Task Force on the Australian Shipbuilding Industry submitted to the Government in January 1984 recommended action be taken to increase the through-put of Australian yards. In October 1984, a major new package designed to assist the Australian Shipbuilding Industry was announced by the Government. The package included the extension of the bounty to cover ships built for export; a proposed industrial agreement between industry and the ACTU; introduction of registration criteria for shipbuilders who want to claim bounty; and the establishment of a Shipbuilding Consultative Group to monitor progress in the industry and register shipbuilders.

In August 1986, the Government announced changes to the shipbuilding bounty arrangements, including the setting of an absolute limit of \$144 million on funds available for bountiable ships over the period to the end of June 1989. The distinction between vessels built for domestic and export markets was ended for purposes of bounty eligibility. Builders of domestic vessels, like builders of export vessels, are required to reserve bounty funds from within the \$144 million. In addition, the rate of bounty for certain classes of vessels was reduced from 20 per cent to 15 per cent from 1 January 1988. The higher rate still applies to tugs, bulk carriers, rig servicing and fishing vessels and to all vessel modifications. A further significant change has been the application of orderly development criteria to all shipbuilders seeking access to bounty.

As at 30 June 1987, 27 shipbuilders were registered for bounty purposes. In 1986-87, 64 bountiable vessels were completed—the largest number constructed in any one year since the introduction of the *Bounty (Ships) Act 1980* and an increase of 3 per cent over 1985-86.

Total financial assistance to the Australian shipbuilding industry in 1986-87 amounted to \$42.0 million (as compared to \$38.7 million in 1985-86 and \$28.5 million in 1984-85).

### **Ship repair**

In October 1986, the Government announced a \$6 million ship repair assistance package aimed at strengthening the ship repair industry. Two major elements of the package are the bounty payable to registered ship repairers, and the extension of the Department of Transport and Communications' official ship safety inspection system to give effect to internationally accepted health and safety standards based on the International Labour Organisation (ILO) Convention 147. The bounty applies to international trading vessels of at least 6,000 deadweight tonnes whether Australian or foreign owned and is payable up to 30 per cent of the repair contract price. To be eligible for bounty, repairers must be registered under the *Bounty (Ship Repair) Act 1986*.

## Importation of ships

The control of imports forms an integral part of the government's shipbuilding assistance arrangements, complementing the bounty legislation. Under the Customs (Prohibited Imports) Regulations, new ships over 150 gross construction tonnes (gct), new fishing vessels over 21 metres in length and second-hand vessels over 70 gct are prohibited imports unless the importer has permission from the Minister for Transport and Communications. All new vessels, second-hand vessels of a type not available new from Australian shipyards, dredges over 2,000 gct and second-hand vessels over 10,000 gct are eligible for permanent importation. In addition, temporary importation, generally for up to two years, of other second-hand vessels between 70 gct and 10,000 gct may be authorised in certain circumstances, as long as a suitable vessel is not already available locally for the task, or will not become available within a reasonable time.

## Stevedoring industry

In December 1977, legislation was introduced which provided for new administrative, financial and industrial arrangements for the stevedoring industry, and abolished the Australian Stevedoring Industry Authority. The arrangements give the parties directly involved in the industry greater responsibility in the industry's affairs.

The Stevedoring Industry Finance Committee is responsible for the disbursement of funds collected through statutory man-hour and cargo levies.

A federal co-ordinating committee, comprising representatives of the employers and the Waterside Workers' Federation (WWF) and Broken Hill Pty Ltd (BHP) and the Australian National Line, oversees the operation of arrangements agreed to in the General Agreement between employers and the WWF. At the port level such matters are handled by Port Co-ordinating Committees set up in the major ports.

Under section 85A of the *Conciliation and Arbitration Act 1904*, a Port Conciliator Service was created to assist parties to an industry award to implement the procedures of that award for the prevention or settling of disputes.

A non-statutory Stevedoring Industry Consultative Council has been established to provide a forum for discussion and liaison between governments, user interests and the operating sections of the industry. The Chairman is appointed by the Commonwealth Government.

The Statutory provisions relating to the industry are contained in the *Stevedoring Industry Finance Committee Act 1977*, the *Stevedoring Industry Levy Act 1977*, the *Stevedoring Industry Levy Collection Act 1977*, the *Port Statistics Act 1977* and Part III, Division 4 of the *Conciliation and Arbitration Act 1904*.

## Waterfront Strategy

In December 1986, the Federal Government announced a comprehensive strategy to improve the efficiency, productivity, reliability and industrial relations record of Australia's waterfront and related industries. The Waterfront Strategy was developed following consideration of the Report of the Industry Task Force on Shore-Based Shipping Costs.

The strategy involves four industry based groups working under the umbrella of the Interstate Commission, implementing solutions to problems in their separate areas of the shore-based shipping industry. The four industry groups are: Stevedoring Industry Review Committee; Importer/Exporter Panel; Industry Committee; and Australian Transport Advisory Council's Standing Committee on Transport.

## Tasmanian Freight Equalisation Scheme

The Tasmanian Freight Equalisation Scheme was introduced from 1 July 1976 to provide assistance to the shippers of certain non-bulk goods between Tasmania and the mainland of Australia. The scheme aims to alleviate the additional transport costs which have to be borne by Tasmanian shippers because of their separation from the mainland by sea. Responsibility for administration of the scheme lies within the Transport portfolio.

The northbound component of the scheme applies to specified goods produced in Tasmania which are shipped by sea to the mainland for use or sale. The southbound component covers certain raw materials, machinery and equipment used in Tasmania's manufacturing, mining and primary industries. In 1986-87, \$24.7 million in assistance was paid on northbound and \$2.8 million in assistance was paid for southbound cargoes.

In 1984, the Federal Government requested that the Interstate Commission investigate the scheme. The Commission's report was published in March 1985. Following consideration of the report, the Government decided to implement a number of changes to the scheme recommended by the Commission with effect from 1 September 1985, including the establishment of a Review Authority to provide independent advice on the administration of the scheme.

### Trade Practices Act

The Overseas Cargo Shipping provisions of the *Trade Practices Act 1974 (Part X—Overseas Cargo Shipping)* are administered by the Transport and Communications portfolio.

Part X establishes conditions for the operation of outwards shipping conferences and individual shipowners operating in Australia's outwards trades. Conference agreements between several shipowners in a particular trade make provision for the fixing of common freight rates. They may also include provisions for pooling arrangements and shares of the trade and rationalised sailing schedules.

Part X exempts conferences from the generally applicable anti-restrictive provisions of the Act, and seeks to ensure adequate safeguards to protect shippers through:

- requiring the filing of outwards conference agreements;
- requiring shipowners to give undertakings to hold meaningful negotiations with the designated shipper body, the Australian Shippers' Council (ASC);
- providing for disapproval of a conference agreement to be exercised by the Governor-General on a number of prescribed grounds, such as a failure on the part of the shipowner to comply with an undertaking, lack of due regard to the need for overseas shipping services to be efficient, economical and adequate, prevention or hindrance of an Australian flag operator from engaging efficiently in overseas cargo shipping to a reasonable extent.

Comparable provisions apply to individual shipowners who are not party to a conference agreement.

### Marine pollution

The *Protection of the Sea (Discharge of Oil from Ships) Act 1981*, the *Protection of the Sea (Powers of Intervention) Act 1981*, the *Protection of the Sea (Civil Liability) Act 1981*, the *Protection of the Sea (Shipping Levy)* and *(Shipping Levy Collection) Acts 1981* currently provide the Commonwealth with the power to deal with matters relating to marine oil pollution.

The Acts respectively provide for the control of discharges at sea and provision of control equipment and procedures on ships; empower the Minister to intervene to take action to prevent or reduce pollution, make provision relating to limitation of liability of oil tankers for oil pollution damage; and provide for the collection of a levy to finance the National Plan to Combat Pollution of the Sea by Oil.

Two further important Acts which will apply the provisions of the International Convention for the Prevention of Pollution from Ships 1973-78 were expected to be proclaimed during 1987. The *Protection of the Sea (Prevention of Pollution from Ships) Act 1983* and the *Navigation (Protection of the Sea) Amendment Act 1983* will implement improved provisions concerning the prevention and limitation of pollution by oil and specified noxious substances, and the prohibition or control of discharges of oil or noxious liquid substances at sea. The Acts will also, when proclaimed, require the provision of control equipment and operational procedures on ships.

### Collection and presentation of statistics

Statistics relating to shipping and cargo are compiled from information provided to the Australian Customs Services (ACS) by importers, exporters, shipping companies and their agents. This information is supplied to the Australian Bureau of Statistics by ACS on a regular basis and is used to produce transport oriented statistics via the following two collections:

*Shipping and Cargo (B380)*. A direct collection from shipping companies of details of ship movements and cargo carried.

*Shipping and Air Cargo Commodity Statistics (SACCS)*. A collection which combines information from import and export documents submitted to the ACS with transport and shipping information to provide a comprehensive picture of the transport base of Australia's foreign trade.

## Shipping and Cargo Statistics

### The scope of the statistics

The statistics relate to ships calling at or departing from Australian ports for the purpose of carrying cargo from or to overseas ports. Details are not required for:

- (i) naval ships;
- (ii) yachts and other craft used for pleasure;
- (iii) foreign fishing ships that neither load nor discharge cargo;
- (iv) Australian registered fishing ships operating from Australian ports;
- (v) geographical survey ships, seismic survey ships, oceanographic survey ships;
- (vi) offshore oil drilling rigs and ships servicing them;
- (vii) ships of 200 registered net tonnes and under.

### Period covered by the statistics

Shipping and cargo statistics are compiled, on a financial year basis, according to the period during which ships actually arrived or departed Australian shores.

### Ship characteristics

#### Ship recording

Ship movement statistics are recorded as 'Ship Number' and 'Ship Calls'. 'Ship Number' relates to the number of overseas direct arrivals to, or departures from Australia. 'Ship Calls' relates to the number of port visits that an overseas ship makes in Australia. For example, an overseas ship which arrives direct in Brisbane and makes a further call in Sydney before departing for an overseas port from Melbourne is counted as one under 'Ship Number' for both arrivals (Brisbane) and departures (Melbourne) and as one arrival call and one departure call for each of the three ports.

#### Ship type

All ships are classified from *Lloyd's Register of Shipping* according to one of 11 ship types which describe them in terms of their structure or design. These 11 ship types are amalgamated into four broad categories.

| <i>Category</i>               | <i>Ship types</i>                                                                          |
|-------------------------------|--------------------------------------------------------------------------------------------|
| General cargo ships . . . . . | Container ships<br>Conventional cargo ships<br>Roll on-Roll off ships<br>Other cargo ships |
| Tankers . . . . .             | Gas carriers<br>Liquid tankers                                                             |
| Bulk carriers . . . . .       | Dry bulk carriers<br>Dry/wet bulk carriers                                                 |
| Other ships . . . . .         | Multi-purpose ships<br>Passenger ships<br>Other ships                                      |

### **Type of service**

Ships are also classified according to the type of service they provide. The two types of service for which statistics are shown are:

- (a) *liner service*, (according to conference and non-conference) relates specifically to a ship which is operated by a carrier providing services on a specified route on a relatively regular basis;
- (b) *other service*, which refers to all ships operating in other than a liner service.

Conference ships—A 'conference' is an association of shipowners which regulates the freight rates and terms and conditions of carriage of goods in any particular trade. Conferences only operate liner services and not charter services. Conference arrangements normally include provisions for sharing the trade, rationalising sailing schedules and pooling arrangements for resources and revenue.

### **Country of registration**

The country of registration or flag of the ship refers to the country in which the ship is registered according to *Lloyd's Register of Shipping*.

### **Recording of cargo loaded or discharged**

Returns for arrivals show cargo discharged, and returns for departures show cargo loaded, in terms of revenue tonnes and gross weight tonnes. A revenue tonne is the unit of quantity predominantly used in the shipping industry. It is the basis on which freight is charged and may be measured by mass (tonnes) or volume (cubic metres). Revenue tonnes statistics are consequently a mix of mass and volume units and should be used with care. Gross weight is the total weight in tonnes of cargo, excluding the weight of containers, irrespective of the basis on which freight is charged.

### **Container cargo**

Statistics of container cargo refer only to cargo shipped in international containers (including flats but not pallets). To provide a standard measure, all statistics relating to containers are expressed in terms of twenty-foot units. A forty-foot container is therefore recorded as 2 twenty-foot equivalent units (or TEU's).

### **Country of loading or discharge of overseas cargo**

In statistics of overseas shipping and cargo, the country of loading or discharge of overseas cargo is the country of location of the port where the cargo was loaded on to, or is to be discharged from, a reporting ship. The countries shown are not necessarily the countries of origin or ultimate destination of cargo because previous or subsequent transshipments of cargo are not taken into account. The statistics of cargo classified by the country in which it was loaded or discharged cannot therefore be compared directly with statistics of overseas trade classified by country of origin or consignment.

### **Trade area**

Ports at which ships load or discharge cargo are allocated to their respective countries, which are in turn allocated to trade areas in accordance with the Classification of Trade Areas for Cargo Statistics.

It should be noted that a revised trade area classification became effective on 1 July 1984. Care should therefore be taken when comparing trade area statistics for earlier periods with those published using the revised trade area classification.

### **Units of measurement**

The cargo carrying capacity of ships has in the past been measured in terms of registered net tonnage. However, as from 1 July 1979 this statistic has been replaced by deadweight tonnage (DWT).

*Deadweight tonnage.* A measure of the total mass (weight, in tonnes) of cargo, stores, fuel, passengers and crew carried by the ship when loaded to her maximum summer loadline.

*Gross tonnage.* A measure of the enclosed internal volume of a ship and its superstructure, with certain spaces exempt, in units of 1 ton per 2.83 cubic metres.

## Shipping and Air Cargo Commodity Statistics—SACCS

### The scope of the statistics

Inward cargo statistics relate to cargo loaded overseas which is discharged from ships and aircraft at Australian ports and in respect of which Customs import documents have been received. Similarly, outward cargo statistics relate to cargo loaded on ships and aircraft at Australian ports for discharge at overseas ports and in respect of which Customs export documents have been received. Details are not included for: (i) goods imported and exported by parcel post; (ii) direct transit trade, i.e., goods being trans-shipped or moved through Australia for purposes of transport only; (iii) migrants' and passengers' effects for which Customs documents are not required; (iv) certain materials under inter-governmental agreements for defence and similar projects for which Customs documents are not required; (v) ships and aircraft entering and departing Australia under their own power; (vi) to the extent that they can be identified, ships and aircraft purchased for use on overseas routes and any subsequent sales made of such vessels and aircraft; (vii) fish and other sea products landed in Australia and abroad directly from the high seas by Australian ships (such products landed in Australia directly from the high seas by foreign ships are included); (viii) ships and aircraft stores; (ix) export consignments where the value of the goods in each transaction is less than \$250, and import entries lodged on informal clearance documents for values not exceeding \$250.

### Period covered by the statistics

Although both foreign trade statistics and SACCS are compiled from the same source, imports and exports are recorded statistically in the month in which relevant documents are lodged with ACS, whereas SACCS are compiled according to the period during which goods were actually loaded and discharged in Australia.

### Commodity classification

Commodities are classified according to the Australian Transport Freight Commodity Classification (ATFCC). The ATFCC is the Australian standard for classifying goods transported by any of the transport modes; sea, rail, road, air or pipeline. It is a four level classification defining commodities in terms of one or more categories of the Standard International Trade Classification (SITC) or the dissection of the SITC categories embodied in the Australian Import and Export Commodity Classification. At the lowest (the fourth) level of classification the ATFCC has 312 items.

### Valuation

The recorded value of inward cargo is the free on board (f.o.b.) equivalent of the price when the sale of such cargo is conducted under open market conditions. This is in accordance with the provisions of the General Agreement on Tariffs and Trade (GATT) relating to Customs valuation. The recorded value also includes the value of the outside package, other than international containers used for containerised cargo. As additional factors are also considered in arriving at the transaction value of goods for Customs purposes, the f.o.b. value may not always be the same as the Customs value.

For outward cargo, goods actually sold to overseas buyers prior to shipment are valued at the f.o.b. equivalent of the actual price paid to the exporter. Goods shipped on consignment are valued at the f.o.b. equivalent of the price that would have been paid to the exporter had he actually sold the goods to an importer in the country of final destination. As for inward cargo, the recorded value also includes the value of the outside package, other than international containers used for containerised cargo.

### Units of quantity

Gross weight is the total weight in tonnes of cargo, excluding the weight of containers, irrespective of the basis on which freight is charged. Gross weight is not available by commodity for inward cargo.

## Australian trading ships

The following table shows particulars of all Australian trading ships of 150 gross tons or more engaged in the regular overseas, interstate or intrastate services at 30 June 1986.

### SUMMARY OF THE AUSTRALIAN TRADING FLEET OF SHIPS 150 GROSS TONS OR MORE, 30 JUNE 1986

(a) A Demise chartered ship is a foreign owned ship chartered by way of a charter party to an Australian based operator, who is an Australian national and who under the charter party has whole possession and control of the ship, including the right to appoint the master and crew of the ship. (b) Relates to vessels used for commercial purposes.

The following table shows the number and gross tonnage of trading ships of 150 tons or more registered in Australia at 30 June 1986, classified according to year of construction, type of trade in which the ships were engaged, and place of manufacture.

### Shipping at principal ports

The following two tables show the movement of overseas shipping and cargo at Australian ports during 1985-86. The first provides details of the ships calling at Australian ports and the gross weight of cargo loaded and discharged. The second classifies cargo loaded and discharged in terms of whether or not it was transported in ISO containers.

#### OVERSEAS SHIP AND CARGO MOVEMENTS AT AUSTRALIAN PORTS, 1985-86

## Overseas cargo commodity details

The following three tables classify inward and outward overseas cargo according to the Australian Transport Freight Commodity Classification (ATFCC). The second and third tables also provide details of the type of shipping service by which cargo was transported.

**INWARD AND OUTWARD OVERSEAS CARGO: SEA: BY SELECTED COMMODITIES**  
**1985-86**

(a) Excludes commodities regarded as confidential. These items are included in Section 9. (b) Includes commodities regarded as confidential.

### Coastal shipping cargo

The following table shows the gross weight of cargo loaded at an Australian port for discharge at another Australian port. Both inter- and intrastate cargo movements are included. Cargo loaded at, or to be discharged at, an overseas port is excluded.

#### COASTAL CARGO LOADED AND DISCHARGED AT AUSTRALIAN PORTS, 1985-86

('000 gross weight tonnes)

## RAILWAYS

### Government railways

The six government owned railway systems are operated by the State Rail Authority of New South Wales (SRA), 'V/Line' operated by the State Transport Authority of Victoria, Queensland Government Railways (QR), Western Australian Government Railways Commission (WAGRC), the State Transport Authority of South Australia (STA), and the Australian National Railways Commission (ANRC).

Data contained in the following tables have been compiled from a number of sources. These sources include annual reports of the various rail authorities; data supplied by the Rail Industry Council; and data collected directly by the Australian Bureau of Statistics.

As the Australian National system includes routes in more than one State, and the Victorian system extends into New South Wales, the system route-kilometres shown in the following table do not represent route-kilometres within each State and Territory.

(a) One train (i.e. a complete unit of locomotive and vehicles, electric train set, or rail motor) travelling one kilometre for revenue purposes. (b) Includes mixed train-kilometres. (c) Based on ticket sales making allowances for periodical tickets. Tickets sold at concession rates are counted as full journeys. (d) Inter-system traffic is included in the total for each system over which it passes. (e) One tonne carried one kilometre.

(a) Includes Metrail for years 1983-84 to 1985-86. (b) Includes urban rail operations only. (c) Includes Tasmania.

## Non-government railways

The Australian non-government railways covered in this section are those which operate outside industrial estates, harbour precincts, mines and quarries with a route distance exceeding two kilometres.

The figures in the following table have been compiled from information supplied to the Bureau of Transport Economics (BTE) by the various railway operators. All operators provided details of tonnes carried and most provided details of tonne-kilometres performed. In a few cases, the tonne-kilometre figures have been estimated by the BTE using the advised average length of haul.

### TRAFFIC TASK PERFORMED BY AUSTRALIAN NON-GOVERNMENT RAILWAYS

| <i>Year</i>                | <i>Iron ore<br/>railways</i> | <i>Sugar<br/>tramways</i> | <i>Coal<br/>railways (a)</i> | <i>Other<br/>non-government<br/>railways</i> | <i>Total(a)</i> |

(a) Includes transfers to and from Government railways.

## TRAM, BUS, AND FERRY SERVICES

### Trams

At 30 June 1986, tram services were in operation in Melbourne and in Adelaide. Regular tram services ceased to operate in Ballarat on 19 September 1971 and in Bendigo on 16 April 1972. However, services are operated in both cities, on an irregular basis, but generally during holiday periods, as a tourist attraction.

In many parts of Australia, private lines used for special purposes in connection with the timber, mining, sugar, or other industries are often called tramways, but they are more properly railways, and the traffic on them has nothing in common with that of the street tram used for the conveyance of passengers.

### Buses

Services are operated by government or municipal authorities and private operators. Statistics are collected for government and municipal bus services which are located in all capital cities and Newcastle, New South Wales; Rockhampton, Queensland; Launceston and Burnie, Tasmania; and for country road services operated by the Victorian Railways, the State Rail Authority of New South Wales, the Western Australian Government Railways, and the Australian National Railways.

### Ferries

Ferry passenger services are operated in the following States: New South Wales, at Sydney, Newcastle and various other waterways; Western Australia, on the Swan River at Perth; Tasmania, on the Mersey River at Devonport and on the Derwent River at Hobart; and Queensland, on the Brisbane River at Brisbane. Control is exercised by both government authorities and private operators.

### Government and municipal tram and bus services

Because of the development in recent years of the various forms of public road transport under the control of single authorities and the gradual replacement of tram services by bus services, it is not possible to obtain separate statistics for all phases of the activities of each form of transport, particularly financial operations.

## MOTOR VEHICLES

Tables in this section include vehicles owned by private individuals, local government authorities, State governments, and the Commonwealth Government (excluding those belonging to the defence services).

### Survey of motor vehicle usage

A survey was conducted throughout Australia in late 1985 by the Australian Bureau of Statistics for the purpose of gathering information on the usage of motor vehicles. The owners of approximately 60,000 vehicles other than commercial buses were approached for information relating to the usage of their vehicles over the twelve months ended 30 September 1985. The framework from which the sample was drawn was obtained from the motor vehicle registration authorities in all States and Territories. The survey was based on respondents' recollections of their usage of the selected vehicles over their period of ownership during the survey year.

The main purpose of the survey was to determine the total distance travelled by vehicles, classified according to area and purpose of travel. Information was also obtained from the survey on: (i) tonne-kilometres; (ii) average load carried; (iii) vehicle usage (i.e. for hire and reward, ancillary or other); (iv) main type of operation; (v) fuel consumption; (vi) occupant-kilometres; and (vii) driver characteristics.

The following table shows, for Australia, total annual kilometres travelled for the twelve months ended 30 September 1985 classified by vehicle type and purpose of travel. The percentage standard errors (S.E.%) indicate the extent to which the estimates can vary by chance because only a sample and not the total vehicle population was enumerated. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained from a comparable complete enumeration, and about nineteen chances in twenty that the difference will be less than two standard errors. For example, if an estimate of 3,000 million kilometres has a standard error of 5 per cent (i.e. 150 million kilometres), then there would be approximately two chances in three that a comparable complete collection would give a figure within the range of 2,850 million kilometres to 3,150 million kilometres and about nineteen chances in twenty that the figure would be within the range of 2,700 million kilometres to 3,300 million kilometres.

**TOTAL ANNUAL KILOMETRES BY VEHICLE TYPE AND PURPOSE OF TRAVEL

(a) Includes the total kilometres travelled for business purposes of cars, station wagons, motor cycles and utilities and panel vans predominantly used for private purposes. The dissection of business travel into laden/unladen was not sought for these vehicles.

### Motor vehicles on register

Details of motor vehicles on the register are compiled by up-dating motor vehicles census data from information made available by the various motor vehicles registration authorities in the States and Territories. Censuses of motor vehicles have been conducted in respect of 31 December 1955 and 1962, and 30 September 1971, 1976, 1979, 1982 and 1985. At these census dates considerably greater information concerning the particulars shown in the tables following is available. Final detailed results of the 1985 census for each State and Territory and Australia have been published in a combined publication.

**MOTOR VEHICLE CENSUS: 30 SEPTEMBER 1985 (FINAL)**

(a) Excludes motor cycles, tractors, plant and equipment, caravans and trailers.

**Drivers' and riders' licences**

At 30 June 1986, the numbers of licences in force to drive or ride motor vehicles were: New South Wales, 3,516,901; Victoria, 2,588,163; Queensland, 1,600,000 (est); South Australia, 838,007; Western Australia, 846,135; Tasmania, 253,777; Northern Territory, 118,238; Australian Capital Territory, 159,770.

**Registrations of new motor vehicles**

Particulars of registrations of new motor vehicles are shown by type of vehicle in preliminary monthly publications, and by type and make of vehicle in monthly and annual publications of motor vehicle registrations.

In these statistics 'registrations' means registrations processed by the motor vehicle registration authorities in the States and Territories during the period.

## REGISTRATIONS OF NEW MOTOR VEHICLES, BY TYPE OF VEHICLE

## ROADS

A special article on the development of roads in Australia is on page 775.

### Summary of roads used for general traffic

#### Proclaimed or declared roads

The table following is a summary of the roads proclaimed or declared under the Acts of the several States relative to the operations of the central road authorities, and shows the lengths of various classes proclaimed or declared as at 30 June 1986. The central road authority in each State assumes responsibility under the Act for the whole, or a proportion, of the cost of construction and maintenance of these roads, the extent varying from State to State and with the class and locality of the roads. Before proclamation of a main road, consideration is given, in general, to the following points: availability of funds; whether the road is, or will be, within one of several classes of main trunk routes; the value of the roads as connecting links between centres of population or business; whether the district is, or will be, sufficiently served by railways. Provision is also made in some States for the declaration of roads other than main roads. The absence of a particular class in any State does not necessarily imply that there are no roads within that State that might be so classified; the classes are restricted only to roads proclaimed or declared under the Acts. A further point to make is that, through various causes (e.g. insufficiency of funds, man-power or materials), construction or maintenance may not keep pace with gazettal of roads, and, therefore, the condition of a road may not match its status.

#### Total roads

The following table represents an attempt to classify all the roads open for general traffic in Australia, at the latest dates available, according to States and Territories and to certain broad surface groups. The figures in the table for the States are obtained from the Deputy Commonwealth Statistician in each State, and are derived mainly from local government sources.

(a) Excludes road designated but not trafficable. Excludes Lord Howe Island and the unincorporated area of the Western Division.  
 (b) Figures as at 31 December 1985. (c) Excludes roads coming under the responsibility of the State Electricity Commission (38 km),  
 Melbourne and Metropolitan Board of Works (32 km) and Forests Commission (39,656 km). (d) Excludes Forests Department  
 roads. (e) Excludes roads in towns and Local Government Areas.

## **National Association of Australian State Road Authorities—NAASRA**

The National Association of Australian State Road Authorities was established in 1934. The present member authorities are: Department of Main Roads, New South Wales; Road Construction Authority, Victoria; Main Roads Department, Queensland; Highways Department, South Australia; Main Roads Department, Western Australia; Department of Main Roads, Tasmania; Northern Territory Department of Transport and Works; Commonwealth Department of Transport and Communications.

The Association's objectives are to provide a central organisation where, by co-operative effort, a uniform approach to the improvement, planning and development of the Australian road system can be achieved. National standards for road and bridge construction and maintenance and improved administrative and financial control methods are developed by committees of experienced staff from the authorities, with secretarial services provided by a small staff located in Sydney.

This Secretariat arranges publication of the policies and standards which are widely used by road authorities, local government and universities; co-operates with the Standards Association of Australia on the preparation of national codes of practice; and acts as an Australian centre for contact with overseas road bodies and for the circulation of standards published by them.

The Association is a member of the Permanent International Association of Road Congress (PIARC) and of the Road Engineering Association of Asia and Australasia (REAAA).

## **Australian Road Research Board—ARRB**

The Australian Road Research Board is a non-profit-making company founded in 1960 by NAASRA, and is located at Vermont in Victoria. It is financed by Federal and State Government Road Authorities whose permanent heads make up ARRB's Board of Directors. The Executive Director, a full-time employee and member of the Board, is responsible for administering the Director's policies.

The ARRB regularly undertakes and sponsors road and road transport research over a comprehensive range of subjects and disseminates results to appropriate organisations, engineers and scientists involved in the design, location, construction, upkeep and use of roads.

ARRB disseminates road research information through its major biennial conferences and regular symposia, seminars and workshops and through its publications which include the *ARRB Conference Proceedings*, a quarterly journal *Australian Road Research*, the *Source Book for Australian Roads*, symposium and workshop papers and various reports and technical manuals arising out of its many research projects. ARRB also maintains a unique library of road literature and operates a computer-based information service which abstracts and indexes road-related literature and research in progress. In 1987 the Information of Roads (INROADS) data base was made publically accessible on CSIRO's AUSTRALIS system. The INROADS data base lists all ARRB publications from 1960, significant Australian road-related literature from 1977, publications catalogued for the ARRB Library, including some retrospective conversion of a card catalogue from 1984, and an annual update of current research in progress. INROADS supersedes the ARRD and ROAD data bases.

ARRB acts as the Australian member of the Organisation for Economic Co-operation and Development's International Road Research Documentation (IRRD) system, contributing information on Australian literature and projects. IRRD information from all member countries is available to Australians through ARRB's computer search services. ARRB also maintains close contacts with road research organisations in other countries.

## **AIR TRANSPORT**

The Commonwealth imposes safety and operational controls on the Australian aviation industry under the *Commonwealth Air Navigation Act 1920* and regulations made under the Act, which are administered by the Department of Transport and Communications. In accordance with the Act and regulations, the Department determines the rules of the air and general conditions of flight over Australian territory, classifies and licenses air services, approves timetables, negotiates international air transport agreements, and approves international fares and freight rates.

The Department determines airworthiness requirements for civil aircraft and issues certificates of airworthiness, and licenses aircraft operating crews and flying training schools. It is responsible for the operation of the Australian air traffic control and air navigation network, provides (through the Bureau of Meteorology) a national weather information service for aircraft, and co-ordinates search and rescue operations. It licenses all civil aerodromes and also operates Commonwealth-owned civil aerodromes and related facilities.

In accordance with the *Air Navigation (Charges) Act 1952*, administered by the Department of Transport and Communications, the Commonwealth currently imposes charges on aircraft operators for the use of the aerodromes, air route facilities, meteorological services, and search and rescue services it maintains and operates.

## **International activity**

### **International organisations**

Australia is one of the 157 (as at 30 June 1986) members of the International Civil Aviation Organisation (ICAO). Australia has continued its membership of the (governing) Council since ICAO was established in 1947. Australia is also represented on the 15 member Air Navigation Commission which is responsible for drawing up international standards and procedures for the safety, regularity and efficiency of air navigation. In addition, Australia participates in the Commonwealth Air Transport Council, the South Pacific Regional Civil Aviation Council and the Airport Operators Council International.

### **International agreements**

Australia had air service agreements in force with twenty-seven countries at 31 July 1987. Under these agreements, which have full international treaty status, Australia is granted rights to operate services from Australia to and through the countries in question; these rights are exercised by Australia's international airline, Qantas. In return, the designated airlines of the other countries which are partners to these agreements are granted traffic rights in Australia. Australia also had air service arrangements, of less than treaty status, granting traffic rights with seven other countries at 31 July 1987.

### **International scheduled services**

At 31 July 1987, thirty overseas international airlines were operating regular scheduled air services to Australia. The carriers (and contracting states) were: Air Caledonie International (France), Air India (India), Air Nauru (Nauru), Air New Zealand Ltd International (New Zealand), Air Niugini (Papua New Guinea), Air Pacific (Fiji), Alitalia (Italy), British Airways (U.K.), CAAC (Peoples Republic of China), CP Air (Canada), Cathay Pacific Airways (U.K.), Continental Airlines Inc. (U.S.A.), Flying Tiger Line Inc. (U.S.A.), Garuda Indonesian Airways (Indonesia), JAL (Japan), JAT (Yugoslavia), KLM-Royal Dutch Airlines (Netherlands), Lufthansa German Airlines (Federal Republic of Germany), Malaysian Airline System (Malaysia), Merpati Nusantara Airlines (Indonesia), Olympic Airways (Greece), Philippine Airlines (Philippines), Polynesian Airlines Ltd (Western Samoa), Royal Brunei Airlines (Brunei), Singapore Airlines Ltd (Singapore), South African Airways (South Africa), Thai Airways International (Thailand), United Airlines (U.S.A.) and Union de Transports Aeriens (France). Polynesian Airlines Ltd also operates services on behalf of Cook Islands International (Cook Islands) and Air Pacific operates services on behalf of Solair (Solomon Islands).

Qantas, Australia's international airline, operates a fleet of 25 Boeing 747 and 6 Boeing 767 jet aircraft. All shares in Qantas Airways Limited are owned by the Commonwealth Government.

### **International non-scheduled services**

Australia's passenger and freight charter policies encourage in-bound tourism and primary produce export flights.

### **International traffic**

The table following shows particulars of scheduled international airline traffic during 1985-86 moving into and out of an area which embraces Australia and Norfolk Island. These figures do not include traffic between Australia and Norfolk Island.

**AIR TRANSPORT: SCHEDULED INTERNATIONAL AIRLINE TRAFFIC TO AND FROM AUSTRALIA(a), 1985-86**

| Type of traffic                  | Number of flights(b)(c) | Passengers       | Freight tonnes | Mail tonnes |
|----------------------------------|-------------------------|------------------|----------------|-------------|
| <b>Traffic to Australia—</b>     |                         |                  |                |             |
| Qantas Airways Limited . . . . . | 5,733                   | 1,166,062        | 40,716         | n.a.        |
| Other airlines . . . . .         | 7,240                   | 1,605,781        | 70,517         | n.a.        |
| <b>All airlines . . . . .</b>    | <b>12,973</b>           | <b>2,771,843</b> | <b>111,233</b> | <b>n.a.</b> |
| <b>Traffic from Australia—</b>   |                         |                  |                |             |
| Qantas Airways Limited . . . . . | 5,634                   | 1,102,369        | 42,125         | n.a.        |
| Other airlines . . . . .         | 7,153                   | 1,526,782        | 81,618         | n.a.        |
| <b>All airlines . . . . .</b>    | <b>12,787</b>           | <b>2,629,151</b> | <b>123,743</b> | <b>n.a.</b> |

(a) Australia and Norfolk Island. (b) Includes Qantas flights using aircraft leased from other airlines. (c) Difference between in/out numbers arises because some outward flights are operated as non-scheduled, and thus not counted in above table.

Statistics covering the operations of Australia's regular overseas services are shown in the following table. These operations include all stages of Qantas flights linking Australia with overseas countries.

## Domestic activity

Both the Commonwealth and the State Governments may exercise controls over intrastate domestic aviation by virtue of their respective powers under the Constitution. The States of New South Wales, Queensland, Western Australia and Tasmania, and the Northern Territory, license air services within their borders, having regard to public interest and other considerations; in some cases approval of intrastate air fares is also required. Victoria and South Australia choose not to regulate air services and, within these States, Commonwealth requirements only must be satisfied to conduct air services. (The Commonwealth alone regulates interstate aviation and negotiates the provision of international air services with the governments of other countries.)

### Trunk route services

The Commonwealth regulates domestic air transport on economic grounds in Australia through arrangements commonly known as the 'two-airline policy' which have existed in various forms for more than thirty years. Under the policy the operation of regular passenger air services over the main domestic or 'trunk' routes is restricted generally to the Commonwealth-owned Australian National Airlines Commission, trading as Australian Airlines (formerly Trans Australia Airlines) and the privately owned Ansett Airlines of Australia (a division of Ansett Transport Industries (Operations) Pty Ltd, a wholly owned subsidiary of Ansett Transport Industries Ltd). The premises underlying the policy have been that the Australian domestic trunk route network could support no more than two major operators and that any move towards a private or public monopoly was not in the public interest.

As the Commonwealth is generally constrained to licensing domestic air services on operational grounds only, it maintains the policy essentially by using the Customs (Prohibited Imports) Regulations to restrict other operators' access to aircraft which could be used to compete with Australian Airlines and Ansett over the trunk routes. The policy in its present form is based on legislation passed by Parliament in 1981—namely the *Airlines Agreement Act 1981*, the associated *Airlines Equipment Amendment Act 1981* and the *Independent Air Fares Committee Act 1981*.

The *Airlines Agreement Act 1981* approved the 1981 Airlines Agreement, the parties to which are the Commonwealth, Australian Airlines and Ansett. The Agreement provides that the Commonwealth or Ansett may give three years notice of termination.

On 7 October 1987 the Minister for Transport and Communications, Senator Gareth Evans Q.C., announced the Government's intention to withdraw from economic regulation of the domestic aviation industry and placed before the Parliament a motion that the Commonwealth give notice of termination of the Agreement.

At 30 June 1987 the Ansett fleet included 5 Boeing 767s, 12 Boeing 727s, 12 Boeing 737s and 6 Fokker F27 Friendships. At the same date, Australian Airlines operated a fleet of 11 Boeing 727s, 12 Boeing 737s, 3 Airbus A300s and 5 McDonnell-Douglas DC9s.

### Regional services

In addition to their competitive trunk route services, both Ansett and Australian Airlines operate limited domestic regional services on non-competitive routes. There are also a number of smaller regional airlines so-called because in general they provide regular passenger air services in specific geographic regions.

However, in recent years East-West Airlines has considerably extended its network beyond its traditional services within New South Wales. In July 1987, East-West Airlines was purchased by Thomas Nationwide Transport Ltd and News Ltd which jointly own Ansett Transport Industries Ltd. Apart from East-West Airlines, the regional airlines are either owned by Australian Airlines (Air Queensland) or are divisions of Ansett Transport Industries (Operations) Pty Ltd (Ansett of Western Australia, Airlines of New South Wales and Airlines of Northern Australia).

The predominant aircraft types used by regional airlines are the Fokker F28 turbo-jet and the Fokker F27 turbo-prop. East-West Airlines and Air New South Wales use both types; Ansett of Western Australia uses the F28 and BAe 146 turbo-jets; Airlines of Northern Australia and Air Queensland use F27 and DC3 aircraft.

Air Queensland announced that it is to cease all operations at the end of April 1988.

### Commuter services

Commuter operators are, in general, required to hold a supplementary airline licence which authorises regular passenger air services using aircraft with capacity to carry no more than 38 passengers or a 4,200 kg maximum payload. Like regional airlines they generally operate over routes other than trunk routes and often operate into centres not served by an airline. At 30 June 1987 there were 46 operators of commuter services in Australia.

The aircraft types currently used by commuter operators are predominantly those in the 6–10 seat category, such as the Piper PA31 and PA32 and Cessna 310, 402, and 404 series. Many also operate the larger DHC6 Twin Otter, Beechcraft Super King Air, Swearingen Metroliner and Embraer Bandeirante. British Aerospace Jetstream 31 and Shorts 330 and 360 are also used. During 1986 commuter operators carried some 1.1 million passengers.

### General aviation

In addition to trunk route, regional and commuter services, there is a wide range of other activities undertaken by the aviation industry. Charter operations involve the use of aircraft in operations for the carriage of passengers and cargo for hire or reward which are not both scheduled and available to the public. More than 600 operators in Australia hold charter licences.

Aerial work and private operations do not involve the commercial transport of passengers and cargo for hire or reward. Aerial work involves the use of aircraft in operations such as aerial survey, aerial agriculture, advertising and flying training. Holders of charter licences generally hold aerial work licences as well. Private operations include the use of aircraft for the personal transportation of the owner and the carriage of persons or goods without a charge being made for the carriage. In certain circumstances some operations which would otherwise be classified as aerial work may be considered private. No air service licence is required to conduct private operations.

### Cargo services

Cargo, i.e. freight and mail, is also carried on the regular public passenger services operated by Australian Airlines, Ansett, regional airlines and commuters, as well as on charter services. Also Australian Airlines and Ansett each has a dedicated B727 cargo aircraft involved in regular interstate services. The Interstate Parcel Express Company (Australia) Pty Ltd, trading as IPEC Aviation, operates cargo airline services using two Argosy aircraft and domestic cargo charter services using a DC9 aircraft, also over interstate routes.

### Scheduled domestic airlines services

Statistics of all regular domestic airline services are set out in the following table.

(a) Includes flights of all domestic airlines, between airports located within Australia and includes flights by East-West Airlines and Airlines of New South Wales between Australia and Norfolk Island.

**Airport activity—domestic passengers**

The statistics set out in the next table have been compiled by aggregating all domestic airline passenger traffic loaded and unloaded at each airport. They include passengers on flights between Australia and Norfolk Island. At ports where through-passengers transfer between flights, such passengers are counted as embarking as well as disembarking passengers.

General aviation activity, which covers all flying other than scheduled airline operations has grown rapidly throughout Australia in recent years and is an important sector of the Australian aviation industry. Hours flown by general aviation during 1984-85 were estimated at 1.73 million.

**Aerodromes**

The number of aerodromes throughout Australia and its external territories at 30 June 1987 was 436. Sixty-nine were owned by the Commonwealth Government and 367 by local authorities and private interests. The number of licensed helipads throughout Australia and its Territories is 6. Capital expenditure on aerodrome and building construction was \$113.4 million in 1986-87. Maintenance expenditure on Commonwealth Government-owned aerodromes during 1986-87 was \$14.2 million. Expenditure on development and maintenance grants to licensed aerodromes participating in the Local Ownership Plan totalled \$10.2 million.

**Airway facilities**

A total of 511 navigational aids were in service at 30 June 1987. The total includes 250 non-directional beacons (NDB), 108 distance measuring equipment (DME), 21 international distance measuring equipment (DMEI), 80 VHF omni-directional ranges (VOR), 17 instrument landing systems (ILS), five twin locator approach systems and 30 ILS locators. In addition, there are 60 privately owned navigational aids which include one DME, two DMEIs, two VORs and 55 NDBs.

One hundred and ninety-six aerodromes are now equipped with night landing facilities. One hundred and twenty-six Australian-designed 'T' systems (T-VASIS) are operating. Seven long-range surveillance radars, two-short range and seven secondary surveillance radars are also in operation. There are 32 fully equipped Air Traffic Control Centres and 43 flight service units in operation.

**Air transport registrations, licences, etc., in force in Australia**

At 31 December 1986 there were 7,238 aircraft registered in Australia. At the same time 41,338 persons held aeroplane pilot licences, of which 23,289 were private pilots, 4,745 commercial pilots, 1,649 senior commercial pilots, 2,200 air transport pilots and 9,455 student pilots. In addition, 1,910 persons held helicopter pilot licences of which 231 were private pilots, 826 commercial pilots, 124 senior commercial pilots and 729 student pilots. There were also 15 gyroplane, 31 commercial balloon, 827 flight engineer and 13 navigator licences in force.

## Accidents and casualties

### AIR TRANSPORT: ACCIDENTS INVOLVING CASUALTIES (a), AUSTRALIA (b)

|                                     | 1981 | 1982 | 1983 | 1984 | 1985 | 1986 |
|-------------------------------------|------|------|------|------|------|------|
| Number . . . . .                    | 39   | 51   | 44   | 40   | 31   | 40   |
| Persons killed . . . . .            | 53   | 53   | 47   | 45   | 43   | 44   |
| Persons seriously injured . . . . . | 33   | 35   | 29   | 25   | 27   | 31   |

(a) Accidents involving civil aircraft (including registered gliders) which resulted in death or serious injury. Excludes parachutists and casualties involving non-registered aircraft. (b) Excludes accidents outside Australia involving aircraft on the Australian register, includes all accidents to overseas registered aircraft that occur in Australia.

## POSTAL, TELECOMMUNICATIONS AND RADIOCOMMUNICATIONS SERVICES

In this section, particulars for the Australian Capital Territory are included with those for New South Wales, and the South Australian figures include particulars for the Northern Territory, unless otherwise indicated.

### Australian Postal Commission

The Australian Postal Commission was established under the *Postal Services Act 1975*. It commenced operations on 1 July 1975 and trades under the name Australia Post.

Under the Postal Services Act, the Australian Postal Commission is required to operate Australia's postal services in such a manner as will best meet the social, industrial and commercial needs of the Australian people. In performing its functions, the Commission is required to have regard for the special needs for postal services of Australian people who reside or carry out business outside the cities. It is also required to raise sufficient revenue to cover operating expenditure and to fund at least half of its capital expenditure.

Australia Post provides surface and airmail services within Australia and to and from other countries. Special services provided include express courier, electronic mail, priority paid mail, business reply post, cash-on-delivery, certified mail, freepost, messenger delivery, a security mail service and a number of reduced rate services.

Australia Post operates a money transfer service, sells postal products such as padded post bags, postal stationery and philatelic items, and acts as agent on behalf of Commonwealth, State and local Government departments and authorities and for private sector principals.

Australia Post is the authority for the issue of postage stamps throughout the Commonwealth of Australia and its external territories.

The following tables give details of Australia Post's financial results, services and operation.

## Telecommunications services within Australia

The Australian Telecommunications Commission was established on 1 July 1975 under the provisions of the *Telecommunications Act 1975* and operates under the trading name Telecom Australia.

### Functions

Under section 7 of the Telecommunications Act the Minister may, after consultation with the Commission, give to the Commission, in writing, directions with respect to the performance of its functions and the exercise of its powers, as appear necessary in the public interest. The functions of the Commission are to:

- plan, establish, maintain and operate telecommunications services within Australia;
- operate such other services as the Commission is authorised by the Telecommunications Act to operate;
- provide, at the request of the Commonwealth Government, technical assistance outside Australia in relation to the planning, establishment, maintenance and operation of telecommunications services in countries outside Australia;
- do anything incidental or conducive to the performance of any of the preceding functions.

The Commission is required to perform its functions in such a manner as will best meet the social, industrial and commercial needs of the Australian people for telecommunications services and make its services available throughout Australia for all people who reasonably require those services.

## Subsidiary and associated companies

The Commission may also, with the approval of the Minister, form, or participate with other persons in the formation of, a company that would carry on a business relating to telecommunications. Pursuant to the powers conferred on it by legislative amendments contained in section 10A of the Telecommunications Act, Telecom has:

- formed a wholly-owned subsidiary company, Telecom Australia (International) Limited, to engage in international consulting and project management;
- formed a private company, QPSX Communications Pty Ltd, to develop a high-speed distributed packet switch network (Telecom owns a 60 per cent equity in the company);
- participated in the formation of a company, National Protocol Support Centre Ltd, which will provide a reference, support, testing and evaluation service to industry in relation to Open System Interconnection interface protocols.

Telecom holds a 25 per cent shareholding in AUSSAT Pty Ltd.

## Statistics

The following table shows selected statistics relating to the latest three years of the Commission's operations.

### AUSTRALIAN TELECOMMUNICATIONS COMMISSION: SUMMARY OF SELECTED STATISTICS

## Australia's National Satellite System—AUSSAT

### AUSSAT Pty Ltd

AUSSAT Pty Ltd was established by the Federal Government in November 1981 as a commercial company to own, operate and manage Australia's National Satellite System.

AUSSAT'S Memorandum and Articles of Association and the *Satellite Communications Act 1984* require the company to:

- provide a telecommunications system for Australia by using space satellites and make available the facilities for use in telecommunications systems in neighbouring regions;
- provide service on a non-discriminatory basis and to set fair and equitable charges;
- operate as a commercial taxpaying enterprise paying reasonable dividends to the shareholders.

The company currently has a paid up equity capital of \$100 million. Seventy-five per cent of its shareholding is held by the Australian Government with the remaining 25 per cent being held by Telecom Australia.

AUSSAT has a board of nine directors and employs a staff of some 250 people, the majority of whom are highly qualified engineers, technicians and scientists.

### The Australian National Satellite System

AUSSAT's first generation satellite system comprises three Hughes Aircraft Company HS 376 spin stabilised satellites. Geostationary orbit locations are: AUSSAT 1—160°E longitude, AUSSAT 2—156°E longitude with AUSSAT 3 at 164°E longitude, some 36,000 kilometres above the earth, directly over the equator.

Each satellite has a minimum design life of seven years. The first two satellites, launched by the Space Shuttle in August and November 1985 respectively, are expected to achieve a seven and a half-year life. It is expected that AUSSAT 3, launched in September 1987 by the European ARIANE rocket, will achieve an on-orbit life of some ten years.

Each satellite carries four high powered (30 Watt) transponders and eleven standard power (12 Watt) transponders, providing a total of 12 x 30 Watt transponders and 33 x 12 Watt transponders on the three satellite first generation system. The satellites operate in the 12-14 GHz KU Band, on a dual polarised basis to provide for re-use of band width.

The three dish antenna system used on the Australian satellites is a unique and distinguishing feature. The antenna array enables each satellite to provide national beam coverage of the entire Australian continent and its offshore regions and four spot beams covering:

- North East (Queensland)
- Central Australia (Northern Territory and South Australia)
- West (Western Australia)
- South East (New South Wales, Victoria and Tasmania)

The satellites also have the capability of providing a switched beam to cover Papua New Guinea, and AUSSAT 3 has a switched beam capability covering the south-west Pacific region and New Zealand.

AUSSAT also operates two telemetry, tracking command and monitoring ground stations. The main centre is located in the Sydney suburb of Belrose, and it is from this station that final positioning and maintenance of the satellites in the geostationary orbit is monitored and controlled. A backup to the Belrose Satellite Control Centre is located in the Perth suburb of Lockridge.

### Ground segment

AUSSAT owns and operates a network of eight Major City Earth Stations (MCES) located in Melbourne, Hobart, Adelaide, Perth, Darwin, Brisbane, Sydney and Canberra.

These facilities are designed to provide 'gateway' access to the satellites for AUSSAT customers whose requirements for services do not warrant the purchase of their own satellite earth stations. Microwave or land line connection from each station to customer premises is available.

### Applications

The first AUSSAT satellite was commissioned for service on 1 October 1985 with the second satellite coming on-line on 1 January 1986.

Since commencing operation, the satellite system has proven to be an outstanding success with demand for capacity being far greater than originally projected. More than 80 per cent of available capacity on the first two satellites has been contracted and is now in service.

The design of the satellite communications payload and beam configuration provides multi-purpose capabilities for the system. It allows for the provision of broadcast services for television and radio, as well as program distribution and interchange and for a full range of telecommunication services such as voice, video, telex and data.

## **Summary of current AUSSAT applications**

### **Broadcasting direct-to-home**

The single largest application at the present time is the provision of broadcasting services for television and radio directly into homes in remote outback regions of Australia. This service, known as the Homestead and Community Broadcasting Satellite Service (HACBSS) is being provided, initially, by the Australian Broadcasting Corporation (ABC). The HACBSS service provided by the ABC comprises television programming, two AM radio services and a stereo FM radio service.

With the launch and commissioning of AUSSAT 3, the service provided by the ABC will be fully supplemented by a similar commercial service known as the Regional Commercial Television Service.

### **Major network television**

Australia's three major television networks are also large users. Each network has leased a standard power (12 watt) transponder and is using the satellite system for program distribution, news gathering and itinerant special program events, such as sporting fixtures.

### **Aviation**

The Department of Transport and Communications has contracted for a total of four standard power transponders which will be used to establish a fully duplicated network of reliable voice and data links between 46 manned air traffic control facilities and 55 unmanned remote VHF air-to-ground facilities throughout Australia.

### **Commercial applications**

Apart from the applications detailed above, AUSSAT has contracted with a number of government agencies and commercial organisations for the provision of a wide variety of services. Uses range from the provision of private network voice, video and data services to exciting applications in entertainment distribution, remote and long distance education, emergency services, health and medical services, including the use of slow scan television for diagnostic purposes.

### **The next generation**

AUSSAT has completed the design of its second generation satellite system planned for launch in 1991-92.

The system, for which tenders were called, will comprise two much larger satellites providing increased capacity and higher power. Tenders closed at the end of 1987 and the contract will be let by mid-1988.

Apart from ensuring continuity of established services the second generation satellites will carry L Band transponders to enable the establishment of a domestic mobile satellite service. This service will be operational by 1992 and could potentially be the first such domestic service in the world.

## **Overseas telecommunications services**

The Overseas Telecommunications Commission Australia (OTC) was formed by an Act of Parliament in 1946. OTC's principal responsibility is to provide, at the lowest possible rates, all of Australia's communications links with other countries and ships at sea. Services provided include telephone, text, data, graphics and maritime communications.

These services, for the business, social, public and private use of all Australians, are provided through OTC's investment in international cable, satellite and radio networks. OTC is a government-owned business enterprise and, as such, operates under the auspices of the Department of Transport and Communications.

OTC achieved a record turnover of \$541 million in 1986-87, an increase of 14 per cent over the previous 12 months. The international telephone service provided around 73 per cent of revenue—an increase of 17 per cent, telex around 9 per cent, and leased services around 5 per cent—an increase of 15 per cent. With a staff of 2,077, profits exceeding \$125 million and assets of more than \$885 million, OTC continues to display the highest productivity of Australian public sector enterprises.

More detailed statistics are contained in OTC's Annual Report.

### **Communications networks**

OTC has developed a sophisticated international telecommunications network using modern digital technology to provide direct connections to almost 200 countries, with onward connections to nearly 300.

All of Australia's worldwide communications are directed via OTC's three international gateways at Paddington and Broadway in Sydney and Scoresby in Melbourne, to the international satellite and submarine cable networks.

Through OTC's shareholding in INTELSAT, Australia is part-owner and sixth-largest user of the global communications satellite system, including operational and spare satellites in orbit above the Atlantic, Indian and Pacific Ocean regions.

OTC's earth stations are strategically placed to access communications satellites above the Indian and Pacific Oceans. There are two OTC satellite earth stations located at Perth, Western Australia, Ceduna, South Australia and Moree, New South Wales; one at Healesville near Melbourne; and one at Oxford Falls in Sydney.

More operations will transfer to Sydney in late 1988. This proximity to a major population centre will allow OTC to provide the best possible quality of service for international communications users.

OTC is the world's third-largest owner of submarine communications systems. Before the end of the century, it is estimated that OTC will need to provide more than 50 times its current international communications capacity. To meet this demand, OTC will invest more than \$2 billion over the next ten years in the world's largest optical fibre cable network spanning the Pacific Ocean.

Wherever submarine cables come ashore, a cable station is located, linking international communications through OTC's gateways to Australia's national communications network. OTC-owned cable stations and junction points are located at Cairns, Perth, Sydney and Norfolk Island.

OTC is also responsible for all communications between Australia and ships at sea, and operates a network of maritime communications stations strategically located around Australia's coastline. OTC is a foundation member of the international maritime satellite organisation, INMARSAT, which provides high-quality voice, text and data communications for suitably equipped vessels.

### **Services**

OTC provides voice, data, video and text communications services that link Australians to the world. These services include OTC International Direct Dial, allowing Australians to dial direct almost 200 countries worldwide; OTC Telex, which allows users to contact 1.6 million subscribers in more than 200 countries; and OTC Data Access, a service that provides access to international databases and computer-based information sharing. Other services include international facsimile, electronic mail, private networks and videoconferencing.

New services are constantly being developed. Teletex, for example, is a text messaging service offering high-speed transmission of fully formatted documents. It will allow computers to fully interface, and facilitate transfer of text between word-processing packages.

### **Radiocommunication stations**

At 30 June 1987 there were 620,721 civil radiocommunication stations authorised for operation in Australia and its Territories. Of these, 291,799 were associated with land mobile services, 15,563 were fixed services, 56,074 were for marine services, 205,823 were citizens band (CB) stations and 16,751 were amateur stations. Particulars of broadcasting stations are shown on page 771.

## BROADCASTING AND TELEVISION

Radio and television broadcasting falls within the jurisdiction of the Commonwealth Government and, pursuant to the *Broadcasting Act 1942*, is one of the responsibilities of the Minister for Transport and Communications. Federal bodies which are involved include the Australian Telecommunications Commission, the Australian Broadcasting Corporation (ABC), the Special Broadcasting Service, the Australian Broadcasting Tribunal, the Department of Transport and Communications, the Overseas Telecommunications Commission and AUSSAT Pty Ltd.

Basically, the Australian broadcasting system comprises the following types of stations:

- national radio and television stations broadcasting programs produced by the Australian Broadcasting Corporation;
- commercial radio and land television stations operated by companies under licence;
- public radio stations operated by corporations under licence on a non-profit basis;
- stations operated under the auspices of the Special Broadcasting Service.

As from 1 January 1977, the Minister for Transport and Communications assumed responsibility for broadcasting planning, including all matters relating to the technical operation of stations, and for the investigation of interference to the transmission and reception of programs.

### The commercial radio and television service

Commercial radio and television stations are operated by companies under licences granted by the Australian Broadcasting Tribunal and with technical operating conditions determined by the Minister for Transport and Communications. The stations obtain income from broadcasting advertisements. At 30 June 1987 there were 139 commercial radio stations in operation in Australia. Call signs for radio stations are prefixed by numerals indicating each State of Australia (2—New South Wales, 3—Victoria, 4—Queensland, 5—South Australia, 6—Western Australia, 7—Tasmania, 8—Northern Territory). In addition there were fifty commercial television stations and 159 commercial television translator stations in operation in Australia. A television translator station is a station of low power designed to receive the signals of another station and re-transmit them; it does not originate programs. There are nine limited coverage repeater stations in Australia operated by mining companies which transmit programs recorded on magnetic tape.

### The public broadcasting service

The Broadcasting Act also makes provision for the granting of licences for the operation of public radio and television stations. At 30 June 1987, 67 public radio stations were broadcasting programs ranging from fine music to ethnic languages and programs produced by and directed towards specific communities. A number of public radio stations are associated with tertiary educational institutions. There are no public television services in operation.

### The Special Broadcasting Service

The Special Broadcasting Service (SBS) was established by the Commonwealth Government on 1 January 1978 to provide multilingual radio services and, if authorised by regulations, to provide multilingual television services. A regulation authorising the provision of multilingual television services was gazetted in August 1978. The service is also empowered by the *Broadcasting Act 1942* to provide broadcasting and television services for such special purposes as are prescribed by the government.

In carrying out its functions, the SBS provides multilingual radio services to the Melbourne metropolitan area and Geelong through radio station 3EA which broadcasts in 55 languages for 126 hours per week; the Sydney metropolitan area through radio station 2EA which broadcasts in 59 languages for 126 hours per week; the provincial centres of Newcastle and Wollongong in N.S.W. through 2EA translator services; plus on relay to a small number of public broadcasting stations throughout Australia.

It also provides Australia's sole national UHF-only television network. Since inception in October 1980, SBS-TV has grown from servicing Melbourne and Sydney only, to providing a television transmission in all capital cities (except Darwin) plus several major regional centres.

Transmitting solely on Ultra High Frequency (UHF), SBS-TV is seen in Sydney, Melbourne/Geelong, Canberra, Adelaide, Brisbane, Perth and Hobart on UHF 28; Adelaide's foothills on UHF 43; North Wollongong on UHF 44; Newcastle on UHF 45; Cooma (N.S.W.), Goulburn (N.S.W.), Tuggeranong (A.C.T.), Warburton (Vic), Marysville (Vic), Queanbeyan (N.S.W.) and Sydney's eastern suburbs on UHF 58; Wollongong on UHF 59; and the Gold Coast on UHF 61. SBS-TV operates to many of these centres via AUSSAT.

## Broadcasting services

### The Australian Broadcasting Tribunal

The Australian Broadcasting Tribunal came into being on 1 January 1977. It is an independent statutory authority established by the *Broadcasting Act 1942* to regulate some aspects of commercial and public radio and commercial television in Australia. The Tribunal is empowered to grant, renew, suspend or revoke licences, to determine program and advertising standards applicable to licensed stations, to authorise changes to the ownership and control of licences, and to collect and make available information about broadcasting in Australia. In particular, the Tribunal is required to conduct public inquiries into the granting of licences following the invitation of applications by the Minister. The Tribunal may also conduct inquiries into the renewal of licences, the setting of standards of broadcasting practices, alleged breaches of licence conditions and other matters.

### The National Broadcasting Service

In sound broadcasting, the programs of the National Broadcasting Service are provided by the Australian Broadcasting Corporation through transmitters operated by Telecom Australia on behalf of the ABC and the Department of Transport and Communications.

#### Technical facilities

At 30 June 1987 the National Broadcasting Service comprised 217 transmitting stations, of which 108 were medium frequency, 103 frequency modulation and 6 high frequency (excluding Radio Australia).

The medium-frequency transmitters operate in the broadcast band 526.5 to 1,606.5 kilohertz. The high-frequency stations, using frequencies within the band of three to thirty megahertz, provide services to listeners in sparsely populated parts of Australia such as the north-west of Western Australia, the Northern Territory, and northern and central Queensland.

Many of the programs provided by country stations are relayed from the capital cities using high-quality program transmission lines. A number of program channels are utilised to link national broadcasting stations in the capital cities of Australia. When necessary, this system is extended to connect both the national and commercial broadcasting stations.

At 30 June 1987, 83 of the ABC's medium-frequency stations were situated outside the six State capital cities.

#### Program facilities

The programs of the ABC cover a wide range of activities. The proportions of broadcasting time allocated on Radio 1 stations to the various types of program during 1985-86 were as follows: entertainment, 51.2 per cent; news, 9.3 per cent; sporting, 15.6 per cent; spoken word, 10.0 per cent; parliament, 11.4 per cent; religious, 1.2 per cent; rural, 0.6 per cent; and presentation, 0.5 per cent. By contrast, the ABC's radio 2 station's programming was: classical music, 41.1 per cent; light music, 0.8 per cent; entertainment, 5.4 per cent; drama and features, 6.3 per cent; education, 5.4 per cent; spoken word, 24.7 per cent; religious, 3.2 per cent; news, 8.1 per cent; rural, 3.4 per cent; and presentation, 1.2 per cent. Radio 3 (regional) stations feature a higher proportion of news and rural programs. Further particulars of the operations of the ABC in respect of music, drama and features, youth education, talks, rural broadcasts, news, and other activities are shown in the Corporation's Annual Report.

### Overseas Broadcasting Service

There are six high-frequency stations at Shepparton, Victoria, three at Darwin, Northern Territory and three at Carnarvon, Western Australia which provide the overseas service known as Radio Australia. As in the case of the National Broadcasting Service, these stations are maintained and operated by Telecom Australia, and their programs are arranged by

Radio Australia. The programs, which, as well as entertainment, give news and information about Australia presented objectively, are directed to most parts of the world but with special emphasis on Asia and the Pacific. They include sixty news bulletins a day. The overseas audience has been quite substantial in recent years, as evidenced by a large number of letters from listeners abroad (169,476 in 1985-86 and 178,231 in 1986-87), Radio Australia broadcasts in nine languages—English, Indonesian, Japanese, Tok Pisin, Thai, French, Standard Chinese, Cantonese and Vietnamese.

**BROADCASTING STATIONS, 30 JUNE 1987**

(a) Includes broadcasting stations 2EA and 3EA operated by the Special Broadcasting Service.

**Television services**

**The National Television Service**

The National Television Service is provided by the ABC through transmitters operated by Telecom Australia on behalf of the ABC and the Department of Transport and Communications. The first national station (ABN Sydney) commenced regular transmission on 5 November 1956.

The television programs provided by the ABC cover a wide range of activities. The proportions of television time allocated among the ABC's various departments during 1986-87 were as follows: drama, 11.9 per cent; children, 25.2 per cent; current affairs, 9.5 per cent; sporting, 13.2 per cent; news, 3.6 per cent; light entertainment, 1.4 per cent; education, 13.7 per cent; popular and video music, 7.8 per cent; religious, 1.2 per cent; arts, 4.3 per cent; and presentation, 4.4 per cent.

During 1986-87, nine new television translator services went into operation—two in New South Wales, two in Victoria, one in Queensland, two in South Australia and two in Tasmania.

**Colour television**

Colour television (PAL) was introduced in Australia late in 1974 and services became fully effective in March 1975.

**TELEVISION TRANSMITTER STATIONS, 30 JUNE 1987**

## THE IMPACT OF TECHNOLOGY ON COMMUNICATIONS

*(This special article has been contributed by the Department of Transport and Communications—written by Ethne McLeod)*

Most parts of Australia are at least 19,000 kilometres from Western Europe, the source of most of her people, equipment, institutions and ideas. Its coastline stretches over 19,000 kilometres and encloses almost as much land as the U.S.A. Communication, therefore, was seen as the lifeblood of a distant colony, alleviating the sense of exile and excommunication, and ultimately has had a crucial influence on Australia's development.

In the first days of colony, letters bound Australia to Britain, carrying social, economic, political and scientific information. No post office existed in Sydney for the first twenty-one years of the colony's life, and mail was handled through ad hoc private arrangements which were subject to widespread abuses. In 1821, New South Wales passed legislation to regulate the postage of mail, in 1828 the office of Postmaster was created for Parramatta, Campbelltown, Liverpool, Penrith, Windsor, Bathurst and Newcastle, thus reflecting the spread of settlement in the colony. The real pacesetter, however, was Tasmania, which in 1828 appointed a Committee of Inquiry into postal reform and, four years later, established a postal service as a government department with the other colonies quickly following suit.

By 1850 New South Wales, Victoria, Queensland, Western Australia, South Australia and Tasmania were extremely urbanised with most of the population living in cities, towns or villages. The gold rushes of the 1850s placed great strains on mail services resulting from the influx of people. Within each colony, the creation of post offices followed the movement of the population. These post offices were staffed, usually on a part-time basis, by men and women drawn from all walks of life and all sectors of the community.

In the mid-19th century a semaphore system was the fastest known means of communication, although this optical telegraph had several drawbacks. It was labour-intensive, totally ineffective at night, and rain, fog, mist and snow dimmed its power. The 1850s, however, saw the advent of electric telegraphy which transformed the business of communication in Australia by adding the crucial element of speed. In 1853 Samuel McGowan brought morse to Australia and the 1860s saw the spread of the telegraph throughout Australia.

By 1869 a distinct pattern had emerged in Australia with telegraph lines concentrated around capital cities and market towns, goldfields and denser pastoral and agricultural settlements. Smaller country towns were channeled into arteries that bridged capital cities. All lines were government-owned and administered in each colony by a department of electric telegraph which was joined to other State responsibilities and departments.

The effect of the new technology was seen in communication itself. For example, newspapers carried information transmitted by telegraph. The telegraph also presented intelligence from neighbouring colonies, news of movements of shipping, the price of goods, and reports from Parliament. The business community rapidly became the pivotal point for the demand for telegraph services as city and country-town offices became commissioning points for orders and centres of market and banking intelligence. The telegraph can also be seen as an important element of central government in the large colonies as a medium for issuing instructions and orders and announcing appointments.

South Australia actively sought to attract support for a link to the telegraph line which stretched overland from England to India. Sturt's journey through the Northern Territory provided the route and in 1872 the continent was spanned by the line which led to the development of Alice Springs and Darwin as repeater stations and provided further bases for exploration of the continent. In 1872, the telegraph cable from Europe and Asia was ultimately linked to the southern cities.

Overseas cable had an immense impact on the Australian colonies. Through fast communication, it generated economic development in the colonies and was a pervasive agent of social change. The overseas cable connection spurred foreign investment in the 1880s and was central to the growth of the business community. By the end of the century, the colonies dovetailed more closely with Britain economically, while at the same time trade connections

with Asia were enlarged. The telegraph became a tool of business and commerce and the foundation of a new information society in Australia.

Development of telephones paralleled the growth of the telegraph system. Telephones were a technology that played a prominent and enhancing role in the lives of women, who immediately entered the workforce of telephony. This trend began with the move of employing postmistresses in country towns and extended gradually to telegraphy. The pattern set in the United States of America was transferred, although with some cultural resistance, to Australia, continuing the trend of opening avenues of employment for women established through the mechanisation of factories. The progress made by women in telegraphy and telephony—both skilled operations requiring training and examinations and endowed with status traditionally beyond the reach of women—marked a striking departure in colonial industrial practice and a notable union between women and new communications technologies.

In 1901 the Constitution empowered the Commonwealth Government to take over, control and administer Posts and Telegraph Departments of each State of the new Commonwealth and 1 March 1901 saw the establishment of the Postmaster-General's Department (PMG) from the former separate and distinctive colonial departments thus creating a national monopoly.

The development of the new Marconi Radio System saw the Department seek absolute control of the new communications system and in 1905 a short Wireless Telegraphy Act, giving the Department control, was passed.

Telecommunications growth was interrupted by World War I although technological advance was stimulated. The outbreak of War caused the rapid growth of wireless stations around the Australian coastline and, by the end of World War I, technological developments saw new prospects for telegraphy and telephony emerging overseas. The 1920s saw the implementation of automatic exchanges and the then Secretary of the Postmaster-General's Department, Mr H. P. Brown, instigated many strategic planning decisions that modernised Australia's telecommunications systems; for example, the systematic extension of automatic exchanges and the development of long-line interstate trunk services.

In March 1922 agreements for wireless telephony to commence were signed and Hughes became the first Australian Prime Minister to make a political broadcast with a speech made at Bendigo and transmitted to an outside audience.

In 1923 it was decided that broadcasting stations would be permitted to forward programs on definite wavelengths to people with 'sealed sets' locked on to one wavelength. Broadcasting began officially on 23 November 1923. However, people wished to listen to any service and the advent of crystal radios helped beat the monopoly of 'sealed sets'. Revised regulations were issued under the Wireless Telegraphy Act in July 1924. A dual system of Class A stations (funded by listeners' license fees) and Class B (other) stations was developed and formed the basis for Australian wireless and television broadcasting. A system also developed whereby any person holding a license could operate any type of receiving equipment for an annual fee. In mid-1928 the concept of a national broadcasting service developed. July 1932 saw the advent of the Australian Broadcasting Commission (ABC) whereby a Government-backed broadcasting system integrated the technical functions of the PMG with the evolution of the ABC.

Australia's overseas telephone system came into being despite economic problems, and technological progress continued. Gradually Australia-wide telephone links were developed and 1934 saw the development of the first overseas airmail service. Telephones helped the development of the Royal Flying Doctor Service which was further stimulated by the growth of the pedal wireless.

World War II has been called the telecommunications war with radar, telephony and telegraph all playing an important role. Increasingly, defence needs shaped telecommunications usage and the War opened up a new creativity in PMG's telecommunications technology from a dependence on carrier technology to Australian designed systems.

From the post-war years, and especially during the 1950s, telecommunications services offered many new developments—automatic telephony and telegraphy, television, electronic computers, microwave radio, rocketry and transistors.

Increasingly, telecommunications equipment was manufactured locally and progressive automation continued.

The Overseas Telecommunications Commission (OTC) was established and Parliament was broadcast for the first time in 1946. In 1953 legislative authority was given to the establishment of both national and commercial television stations. The first commercial television broadcast was from TCN 9 in Sydney on 16 September 1956. The 1956 Olympic Games in Melbourne gave impetus to all forms of telecommunications in Australia.

Television reached all Australian capital cities except Darwin by 1962 and spread outwards to the countryside. Planning commenced for a dual national and commercial system with all the attendant installation of equipment and towers. Radio engineering and research continued as a major area of PMG work, and the ABC began broadcasting on shortwave bands as well as overseas through Radio Australia.

In April 1965 INTELSAT I provided satellite telecommunications services between North America, Britain and Europe. INTELSAT II, launched in October 1966, linked in Australia. The OTC earth station at Carnarvon in Western Australia was linked into the American space program and in 1968 OTC opened a new earth station at Moree that provided a link for integrated data, telephone, telegram, telex and television circuits which effectively linked Australia to the rest of the world.

In 1964 PMG had entered the transmission business using telephone lines to transmit computerised information between stock exchanges and some business houses. In 1969 PMG's 'Datel Service' became the first common user data network using transmission over an ordinary switched telephone network or over privately leased lines. Eventually, a Royal Commission into the Post Office in April 1974 recommended the creation of an independent body solely responsible for telecommunications and, on 1 July 1975, the Australian Telecommunications Commission (Telecom) came into operation.

From the 1960s on, however, PMG had, like other authorities overseas, turned toward the possibility of enlarging and diversifying land-based telecommunications systems through domestic satellite technology. By the late 1960s pilot studies on NASA equipment had demonstrated the feasibility of a geostationary satellite linked with an Australian network, which in addition offered the possibility of taking telephone connections to remote and inhospitable regions.

In 1972 a Special Task Force was established to investigate the possibilities of satellite usage. The Telecom National Satellite Communications System Study was released in November 1977 and suggested that in terms of technical feasibility the proposal should go ahead, though not on economic grounds. In August 1977, as a result of a private report, a political case was mounted on the grounds that television services to areas not currently served could not be provided through the existing communications network, which was neither satisfactory, nor capable of providing such a service to the Australian people. Also in November 1977, a Commonwealth Government Task Force proposed the introduction of a domestic satellite system. The then Minister for Communications, the Hon. A. A. Staley and the Prime Minister, the Rt. Hon. Malcolm Fraser, actively supported the Task Force Report.

In 1981 the Government formed a company (AUSSAT) to own and operate Australia's National Satellite System; shares in the company are jointly held by the Commonwealth Government and Telecom. In 1985 AUSSAT had two satellites launched and they are now fully operational. The domestic satellite system will ultimately complement, diversify and add resilience to existing ground-based communications systems. Significantly it will enable communications throughout the country—from the largest cities to the most isolated areas.

## ROADS: THE BEGINNING AND NOW

*(This special article has been contributed by the Department of Transport and Communications)*

When the first settlers arrived in Australia two hundred years ago, they set in motion an approach to road construction which has culminated in the biggest civil engineering project in the country's history—the National Highway system, 16,000 kilometres of highway that has cost the nation \$5,100 million.

Until the 1840s, most of Australia's towns were on the coast and relied upon the sea for transport. Consequently, road transport was undeveloped. Before that, bullock tracks developed into roads, but they were primitive and badly maintained.

In New South Wales, Governor Macquarie developed a trunk road system which extended as the settlement spread. By 1850, New South Wales had three trunk systems that extended inland—from Sydney to the Yass Plains, from Sydney to Bathurst, and from Morpeth to the upper reaches of the Hunter River. However, road building was slow due to shortage of materials, deterioration caused by climatic conditions, and administrative and financial problems.

As roads improved, coach services were introduced, the major one being Cobb and Co. which operated for almost 70 years.

Even with the advent of the first petrol cars at the turn of the century, travel by rail was still the preferred mode of transport. But as cars improved, it became apparent that road transport would become more popular.

The task of building and maintaining roads became too much for local governments and the more important roads were placed under State government control in the 1920s. Commonwealth assistance was first provided to the States for road making in 1923. By the 1930s, road transport was competing strongly with the railways.

World War II saw a reassessment of roads. Before the War, emphasis had been on well made roads in the main centres of population, but now the emphasis shifted to sparsely populated areas for defence purposes.

The post-war period saw the need for a modern, efficient road system to establish, build and sustain economic growth. The seed had been planted and now, more than thirty years later, the National Highway is all but completed.

Commenced in 1974, the National Highway system links each adjacent State capital, Adelaide with Darwin, and Cairns with Brisbane, as well as linking Hobart to Burnie in Tasmania.

In 1974 as much as 3,900 kilometres of the National Highway was unsealed and deficient, and the length of divided carriageway was less than 300 kilometres. Periodic flooding in outback areas often resulted in road closures, causing long delays to traffic. Now, with the majority of the highway network sealed, the situation has been improved significantly.

All funding for the construction and maintenance of the National Highway system is met by the Federal Government, with State and local road authorities acting as design, construction and maintenance agencies. In addition, the Federal Government provides substantial funding to the States and local government authorities for arterial and local roads. Federal funding for roads comes from a predetermined share of fuel excise taxes.

Following the expiry of the 1981 Roads Grant Act on 30 June 1985, the Australian Land Transport Program (ALTP) began in July 1985, and this five-year program continues to assist the States and Northern Territory in the construction and maintenance of roads.

In 1982 the Australian Bicentennial Road Development (ABRD) Program was introduced to achieve a substantial upgrading of the Australian road network by 1988.

In 1985–86, \$559.3 million was provided for National Roads. Of this, \$377.3 million was for construction and maintenance projects under ALTP, and \$182 million was for construction projects under the ABRD program.

The busiest interstate route is the Hume Highway section of the National Highway, 816 kilometres linking Sydney and Melbourne, of which over 40 per cent is dual carriageway. It carries more than 1,000 heavy commercial vehicles daily in addition to other traffic. Canberra, the national capital, is linked to the Hume Highway by the Barton and Federal Highways.

Melbourne and Adelaide are linked by 720 kilometres of the Western and Dukes Highways, and the South East Highway sections of the National Highway.

Adelaide and Darwin are joined through central Australia by the Stuart Highway section of the National Highway over a distance of 3,014 kilometres. Until 1979, the 925 kilometre South Australian section was little more than a dirt track.

From Adelaide, the Adelaide-Port Augusta Road, the Eyre Highway, Coolgardie, Esperance and the Great Eastern Highway sections of the National Highway stretch 2,675 kilometres along the southern edge of the Nullabor Plain to Perth.

Between Perth and Darwin, the National Highway comprises the Great Northern, Duncan and Victoria Highways covering 4,000 kilometres.

The Barkly Highways section of the National Highway connects Tennant Creek in the Northern Territory to Mt Isa in Queensland, and on the same route, the Flinders, Landsborough and Warrego Highways connect Mt Isa to Brisbane over more than 2,400 kilometres.

In Northern Queensland, Cairns is linked to Brisbane by the Bruce Highway section of the National Highway over 1,690 kilometres. The Cunningham and New England Highway, and the Newcastle-Sydney Freeway (over 1,000 kilometres) provide a link between Brisbane and the Southern States.

In Tasmania, the National Highway links Hobart and Launceston by the Midland Highway over 187 kilometres, and Launceston and Burnie by the Bass Highway over 137 kilometres.

Of the 804,700 kilometres of roads open for general traffic in Australia, 266,600 kilometres, or 33 per cent, are sealed, while the remainder are either gravel or earth pavements.

Victoria, the second smallest State, has the largest percentage of sealed roads with 41 per cent. Tasmania, the smallest State, and New South Wales each has 38 per cent. Queensland has 31 per cent, Western Australia 28 per cent, South Australia 22 per cent, Australian Capital Territory 96 per cent, and the Northern Territory 26 per cent.

Established in just 200 years, Australia's large road network of over 800,000 kilometres services a population of 16 million who drive nine million cars and motorcycles and over half a million trucks.

Information additional to that contained in ABS publications is available in the annual reports and other statements of the Department of Transport and Communications (comprising, since July 1987, the former Departments of Transport, Aviation and Communications), the various harbour boards and trusts, the several government railway authorities, the Australian Postal Commission, the Australian Telecommunications Commission, and the Australian Broadcasting Corporation.

## CHAPTER TWENTY-TWO

### SCIENCE AND TECHNOLOGY

---

Science and technology directly influence the strength and competitiveness of industry by providing a basis for technological change and thereby encouraging economic growth and development. They can be seen as making major contributions to the achievement of many of Australia's social, economic and industrial goals.

There are many organisations in Australia concerned in some way with the development of science and technology in Australia.

The Commonwealth Government's conviction of the importance of science and technology is reflected in the functions of the Department of Industry, Technology and Commerce. Apart from having general responsibility for science and technology, the Department is concerned with the development and maintenance of Australia's scientific and technological capability.

A number of other Commonwealth Government organisations either support or carry out scientific and technological activities. State governments are also involved in science and technology via State government departments, science and technology councils and other organisations. Non-government organisations participating in scientific and technological activities include higher education institutions, professional and learned bodies, private organisations and industry groups.

Information on scientific and technological activities presented in this chapter includes:

- Australian Bureau of Statistics data on resources devoted to research and experimental development (R & D) and other innovative activities. The R & D surveys cover organisations in the business enterprise, general government, private non-profit and higher education sectors.
- Department of Industry, Technology and Commerce statistics on expenditure on R & D and other scientific and technological activities carried out or funded by Commonwealth Government organisations.
- Commonwealth Tertiary Education Commission statistics on tertiary student enrolments.
- Australian Bureau of Statistics information on manufacturing industry technology operations and trade categorised into high technology, medium technology and low technology (industries or commodities).

A special article on science and technology in Australia is included at the end of this chapter.

#### **The Department of Industry, Technology and Commerce—DITAC**

Following the Administrative Arrangements Order of 24 July 1987, the Industry, Technology and Commerce portfolio has primary responsibility for advising the government and implementing policy in relation to Australian science and technology; manufacturing and service industries; export services and customs and excise.

Within the portfolio, DITAC is the central point of contact for industry, unions, other Commonwealth departments, and State and local governments on matters relating to manufacturing and service industries. DITAC incorporates parts of the former Departments of Science, Trade, and Housing and Construction. The major scientific and technological aspects of the portfolio include the following bodies and activities.

#### **The Commonwealth Scientific and Industrial Research Organisation—CSIRO**

CSIRO was established as an independent statutory authority by the *Science and Industry Research Act 1949*. The Act has been amended on a number of occasions since then, but the most significant amendments were made in 1978, following the government instigated 'Birch Committee of Inquiry'. More recently, in November 1986, it was amended to reflect

the decisions on the recommendations of the Review of Public Investment in Research and Development in Australia, including specifically CSIRO, carried out by the Australian Science and Technology Council (ASTEC).

The decisions announced by the Government in 1986 and reflected in the 1986 amendments to the Act, confirm that CSIRO's primary role is to continue as an applications oriented research organisation in support of major industry sectors and selected areas of community interest, but with a stronger commitment to the effective transfer of its results to users. The most recent amendments have also included changes to the top management structure and the Organisation's advisory mechanisms.

Briefly, CSIRO's primary statutory functions are to:

- carry out scientific research relevant to Australian industry, the community, national objectives, national or international responsibilities, or for any other purpose determined by the Minister;
- encourage or facilitate the application or utilisation of the results of such researchs.

Other functions include dissemination and publication of scientific information, international liaison in scientific matters, and provision of services and facilities.

The research work of the Organisation is carried out in Institutes, each headed by a Director and each specifically established to undertake work in support of industry or community interest sectors of the Australian economy. Institutes are comprised of Divisions, which are each responsible for broad programs of research in support of the objectives of the Institute.

*Institute of Information and Communication Technologies:* Divisions of Information Technology, Radiophysics, Mathematics and Statistics; CSIRO Office of Space Science and Applications.

*Institute of Industrial Technologies:* Divisions of Manufacturing Technology, Materials Science and Technology, Applied Physics, Chemicals and Polymers.

*Institute of Minerals, Energy and Construction:* Divisions of Construction and Engineering, Exploration Technology, Mineral and Process Engineering, Mineral Products, Coal Industry, Fuels Production.

*Institute of Animal Production and Processing:* Divisions of Animal Health, Animal Production, Wool Technology, Tropical Animal Production, Food Processing, Human Nutrition.

*Institute of Plant Production and Processing:* Divisions of Plant Industry, Tropical Crops and Pastures, Horticulture, Entomology, Soils, Forestry and Forest Products.

*Institute of Natural Resources and Environment:* Divisions of Water Resources Research, Fisheries, Oceanography, Atmospheric Research, Wildlife and Ecology; Centre for Environmental Mechanics.

On 30 June 1987, CSIRO had a total staff of 7,347 in more than 100 locations throughout Australia. About one-third of the staff were professional scientists, with the others providing technical, administrative or other support.

### **Commercial activities**

The main aim of CSIRO's commercial activities has been to achieve the maximum possible economic and social benefits to Australia by contributing to commercially viable innovation. During recent years, there has been a greater emphasis on research that can be exploited by Australian industry, or that will bring more substantial benefits to Australia. The selection of commercial partners with the capability of developing, applying and marketing innovations has become even more significant in the planning and evaluation of research in CSIRO. A second but important aim of CSIRO's commercial policy is to continue to maximise CSIRO's revenue from its commercial transactions.

### **SIROTECH Limited**

In the first eighteen months of its operation, SIROTECH has come to the forefront in technology transfer in Australia. SIROTECH was established by CSIRO in 1985 to help transfer research results with sound commercial potential to the Australian industry most suited to making use of those results. SIROTECH has been able to help identify and evaluate commercial opportunities, package and market them to industry and negotiate terms and finalise agreements. As a company set up to 'act commercially', it has continued to develop its capabilities in patent and intellectual property management, technology evaluation, market assessment and advice and successful negotiation of commercial agreements. By mid-1986 more than 60 commercial agreements had been negotiated in medium to large-scale projects as well as smaller projects.

CSIRO's budget for 1986-87 was \$446m.

## **The Australian Nuclear Science and Technology Organisation—ANSTO**

ANSTO was established on 27 April 1987 as a statutory authority by the Commonwealth Parliament under the *Australian Nuclear Science and Technology Organisation Act Number 3 of 1987*. ANSTO replaces the Australian Atomic Energy Commission, which had been in existence since 1953.

ANSTO is Australia's national nuclear organisation. It has its headquarters and all but a few of its staff at the Lucas Heights Research Laboratories, 30 kilometres south-west of Sydney. Of its staff of 1,050 about 270 are qualified scientists and engineers. Its mission is to benefit the Australian community by the development and application of nuclear science and technology in industry, medicine, agriculture, science and other fields. In this mission, ANSTO maintains a high regional and international standing in nuclear matters and carries out tasks as required by the Commonwealth Government.

The four major activities of ANSTO are:

- the conduct of research and development in the major areas of industrial applications, biomedicine and health, and environmental protection;
- the provision of expert technical advice;
- the operation of national nuclear facilities;
- the commercial marketing of products and services.

ANSTO's annual expenditure is in the order of \$56m, with sales revenue of approximately \$4m.

## **The 150 per cent Tax Concession for Research and Development**

As an encouragement to the private sector to carry out more R&D, the Government offers a tax incentive for certain R&D expenditures. The concession applied from 1 July 1985 and is available to eligible companies undertaking R&D in Australia. Allowable R&D expenditures over \$50,000 per annum attract a 150 per cent taxation deduction, with a phased scale for deductibility of amounts less than \$50,000 but more than \$20,000.

## **The Grants for Industry Research and Development Scheme**

The scheme provides grants to support approved R&D projects in three areas, being: discretionary grants of up to 50 per cent of agreed costs, generally for companies unable to benefit from the tax concession; generic technology grants, providing up to 90 per cent of agreed costs, designed to support new technologies with particular significance for industry development; and national interest agreements, providing up to 100 per cent of costs for R&D projects with significant benefits for Australia. The scheme applied from 1 July 1986 and replaced the Australian Industrial Research and Development Incentives Scheme.

## **Patent, Trade Marks and Designs Office**

The office protects Australia's technological and commercial interests through the industrial property program. It also protects the public interest through examination and registration of patent, trade mark and design applications and provides a patent information service.

## **The National Industry Extension Service—NIES**

NIES is a joint Commonwealth and State Government initiative established in July 1986 to upgrade and co-ordinate the wide range of advisory and assistance services available to industry. NIES is helping Australian firms achieve international competitiveness by encouraging the adoption of improved technologies, management and business practices. Through a single contact point in each State and Territory, firms can be provided with information, or referred to appropriate specialist sources of advice, on issues that include strategic business planning, product innovation, design, quality, the application of new technologies, marketing, the contribution of labour, and issues of particular concern to small business. Financial assistance may be provided towards the cost of business planning services.

Funds are provided through DITAC's Budget allocation to the States and Territories to assist them in delivering NIES services to industry. In addition, funding is provided for the

national NIES program, which includes the development of new elements of the program and assistance to five non-profit providers of extension services: the Technology Transfer Council, Australian Productivity Council, Industrial Design Council of Australia, Standards Association of Australia, and National Association of Testing Authorities.

### **The Management and Investment Companies Program**

In 1984, the Government established the Management and Investment Companies Licensing Board to encourage the development of a venture capital market in Australia. The main objective of the program is to attract management and financial support for the start-up and early growth of those Australian based enterprises which have the potential to grow rapidly into substantial businesses, are export oriented and use innovative technology. To 31 August 1987, over \$102m had been invested in 125 businesses in a wide variety of industries.

### **The Bureau of Industry Economics**

Primary responsibility for the Department's Industry Research Program lies with the Bureau of Industry Economics, which was established in 1977 as a centre for research into the Australian manufacturing and commerce sectors of the economy. The Bureau is assisted in devising its research program by a Council of Advice, comprising business and union leaders and prominent academics.

The Bureau's research program is concerned with a broad range of industry policy issues, including:

- individual industry studies as well as the investigations of general issues affecting a broad range of manufacturing and service industries;
- forward-looking studies on the likely future development of Australian industry, as well as detailed investigations of the factors responsible for the performance of industry in the recent past;
- aspects of industrial technology and production as well as pricing and marketing issues.

Evaluation of the effectiveness of existing government policies and programs is an important part of the Bureau's research. The Bureau also contributes to policy reviews, including Industries Assistance Commission and other public inquiries, and assesses the economic aspects of papers put to it by industry and trade unions.

### **The Snowy Mountains Engineering Corporation**

A statutory authority operating on a commercial basis, the Corporation utilises the professional engineering expertise developed during construction of the Snowy Mountains Hydro-electricity Scheme. It has completed nearly 1,300 projects in 45 countries, including Australia.

### **The Australian Institute of Marine Science**

The responsibilities of the Institute are to conduct research and to arrange and co-operate with other institutions or individuals, in conducting marine science research as well as to collect and disseminate information relating to marine science. Its objectives are to advance the development of national knowledge of the marine environment; to communicate this knowledge so that it can be applied to the development, conservation and management of the marine resources, to create opportunities for technological and commercial development and to foster co-operation between researchers with similar interests.

The Institute's core research is organised into four closely integrated programs—coastal processes and resources, reef studies, environmental studies and marine systems analysis. These core research programs have been augmented by funding from other agencies which allows for continuing major research on the crown-of-thorns starfish phenomenon, accelerated research on weather records in corals and mangrove forests and assistance to ASEAN countries to develop technologies for assessing their coastal marine resources, especially mangroves and coral reefs.

The Institute's total budget in 1987-88 was \$11.4m, of which \$1.2m was funded from other agencies. Its core staff of 106 is supplemented by some 22 staff funded by other agencies.

### **The Commission for the Future**

The Commission's objective of raising community awareness of all aspects of the social and economic impacts of technological change is based on the premise that industrial restructuring and technological development alone are insufficient for the development of a productive Australian culture. A need exists for an information and education program directed at increasing support for, and understanding of, scientific and technological change and long-term options for Australia.

### **The National Building Technology Centre**

The objectives of the Centre are to develop and promote innovative and cost-effective building practices and to advise on formulation of appropriate codes and standards.

### **The Australian Space Board**

The Board was established to advise the government on space R&D priorities in accordance with the government's broader industry and technology policies. Part of the Board's functions include supervising and accounting for National Space Program activities funded through the Department. Those activities include providing financial incentives to companies for involvement in space-related technologies and R&D.

### **The National Standards Commission**

The National Standards Commission is responsible for determining the legal units and standards of physical measurement, co-ordinating the national measurement system and approving measuring instruments for use in trade. In September 1984, the Weights and Measures (National Standards) Act was amended and the title changed to the National Measurement Act. The amendments clarified the functions of the Commission and transferred to it responsibility for completing the introduction of the metric system of measurement into Australia. This was previously a function of the Metric Conversion Board.

Following a review of the trade measurement system in 1984, the Commission has been chairing a working party of State and Territory Weights and Measures Authorities to develop Uniform Trade Measurement Legislation for Australia.

### **Expenditure**

Science and technology (S&T) expenditures within the portfolio of the Minister for Industry, Technology and Commerce for 1986-87 were as follows:

Intramural (in-house) R&D expenditure \$454m.

Extramural (grants, contracts, etc.) R&D expenditure \$60m.

S&T (including R&D) expenditure \$688m.

### **Other Commonwealth Government science and technology activities**

Many other Commonwealth Government agencies play a significant role in the science and technology area. A number of these agencies are involved with R&D activities either as funders, performers or both; others are active in the S&T areas of information dissemination, scientific services and scientific training.

### **The Australian International Development Assistance Bureau**

The Bureau provides funds under a number of arrangements to provide scientific development and training in many third world countries. In 1986-87 the Bureau spent \$219m on science and technology, \$39m of which was provided as R&D funding.

### **The Defence Science and Technology Organisation—DSTO**

DSTO is a major R&D performer in the defence field in Australia, spending \$148m on its own research programs in 1986-87. Other S&T activities include provision of scientific and technological advice on defence policy matters and equipment, and development and maintenance of a skill base in defence science and technology.

---

### **The Commonwealth Department of Employment, Education and Training**

The Department funds scientific and technical training in tertiary institutions via the Commonwealth Tertiary Education Commission. In addition, the Department has established the Australian Research Council to provide advice on national research policy priorities and on the co-ordination of national research effort. The Council will also co-ordinate and advise on specific research funds for tertiary education institutes, post-graduate research awards and research grants and fellowship schemes.

### **The Commonwealth Department of Community Services and Health**

The Department is the major Australian provider of medical research funds through the National Health and Medical Research Council. In 1986-87, the value of grants awarded to medical researchers was \$59m. Other S&T activities of the Department include provision of funds for the National Biological Standards Laboratory (\$13m in 1986-87), Commonwealth Pathology Laboratories (\$17m in 1986-87) and the Commonwealth Serum Laboratories (\$10m in 1986-87).

### **The Australian Telecommunications Commission**

'Telecom Australia' operates and maintains the national telecommunications network. It is a major R&D and S&T performer (\$56m and \$141m respectively in 1986-87). Its R&D activities include planning and specification of Australian telecommunications requirements and the solution of technical problems arising during the operation of its telecommunication networks. Telecom's other S&T activities include planning and operation of new facilities and development of the network infrastructure.

### **The Australian Bureau of Statistics**

The Bureau is the Commonwealth Government's central statistical authority and is responsible for providing statistical services to government and private users. Other activities include the co-ordination of statistical activities of official bodies and the provision of statistical advice and assistance to official bodies. All of the Bureau's expenditure (\$164m in 1986-87) is considered to be on science and technology (predominantly data collection in the social sciences), with a small proportion (\$10m in 1986-87) attributable to R&D.

### **The Bureau of Meteorology**

The Bureau provides the national meteorological service and performs the R&D needed to maintain the service. The Bureau's total S&T expenditure for 1986-87 was \$86m, of which \$3m was for R&D.

### **The Antarctic Division of the Department of Arts, Sport and the Environment, Tourism and Territories**

The Division manages Australia's Antarctic program. It organises expeditions and maintains research stations, as well as funding, co-ordinating and conducting research. The Division's S&T spending for 1986-87 was \$42m and its R&D expenditure was \$27m.

### **The Rural Industry Research Schemes**

The schemes, administered by the Department of Primary Industries and Energy, cover one general and 15 specific rural industries. They provide funds for rural research and dissemination of agricultural information. Funding for most of the schemes comes equally from the Commonwealth and industry (via a levy on produce). In 1986-87, the schemes contributed \$26m to rural research (\$10m of which was industry funded).

## **The Bureau of Mineral Resources—BMR**

The Bureau's main functions are to understand and assess Australian geology as a basis for mineral exploration, to be the primary information source for geoscience data, and to monitor earthquake activity and underground nuclear explosions. BMR's R&D activities are in the areas of fossil fuel, minerals and ground water; spending on R&D in 1986-87 was \$30m. Total S&T expenditure in 1986-87 was \$37m.

## **Advice on science and technology**

Apart from DITAC, the most significant Commonwealth Government advisory body on science and technology is the Australian Science and Technology Council (ASTEC), a statutory authority advising the Prime Minister and government on science and technology matters. ASTEC's 1986-87 expenditure was \$1.4m. For a fuller discussion of ASTEC's role and functions see *Year Book* No. 70.

## **State government science and technology activities**

State governments are major performers and supporters of scientific and technological activities. Many States have particular departments established for the purpose of encouraging and co-ordinating the use of technology in industry (e.g. the Victorian Department of Industry, Technology and Resources). Several States (New South Wales, Queensland, Western Australia and South Australia) have also established science and technology councils which provide advice to State governments on science and technology matters and promote the expansion of technology.

In addition to fostering science and technology, many State government departments are large performers of scientific and technological activities. Traditionally, for instance, those departments involved with agriculture (e.g. the Victorian Department of Agriculture and Rural Affairs and various State departments of agriculture) spend large sums on the R&D which they perform and also have a high profile in the general S&T activities of extension and laboratory services.

The total 1984-85 expenditure for R&D carried out by State government organisations on agricultural objectives was \$197m, 68 per cent of total State government R&D spending for that year. Other major areas of State government R&D activity are Forestry and Fisheries (\$24m in 1984-85) and Health (\$22m in 1984-85).

## **Tertiary education institutions' science and technology activities**

Tertiary education institutions play a vital role in the two major S&T areas. These being R&D and scientific and technical training.

Universities receive direct funding for research purposes from a number of sources, the major one being the Commonwealth Government. Commonwealth funds include those administered by the Commonwealth Tertiary Education Commission (special research grants, research equipment grants); those grants and awards distributed through the Australian Research Council; and grants awarded by the National Health and Medical Research Council and through the National Energy Research, Development and Demonstration Program. Direct Commonwealth research funding for 1986 totalled \$127m. Direct funds for research from other organisations and individuals totalled \$58m in 1986.

Indirect research funding for universities includes both the proportion of general funds from the States Grants (Tertiary Education Assistance) Act allocated by universities to research (\$104.0m in 1986) and the amount attributable to research but coming from general teaching-and-research funds (e.g. the estimated research portion of the salaries of teaching-and-research staff). The latest available figures for total university research expenditure (direct plus indirect sources) came from the ABS inter-year R&D survey for 1985 which gives an estimated expenditure of \$708m.

CAE's and institutes of TAFE receive very little research funding from the Commonwealth. The Australian Bureau of Statistics measures R&D effort for CAEs (\$23m in 1984) but does not survey institutes of TAFE.

Data on university and advanced education enrolments by field of study are presented in the table below. Other enrolment data for universities and advanced education and data on TAFE enrolments are presented in Chapter 10, Education. That chapter also gives a more detailed picture of higher education facilities in Australia.

### **Other organisations' science and technology activities**

There are many other non-government organisations playing an important part in Australia's scientific and technological development. They include various learned and professional bodies such as the Australian Academy of Science, the Australian Academy of Technological Science, the Academy of Social Sciences in Australia and the Australian and New Zealand Association for the Advancement of Science. Their activities include provision of advice in the relevant scientific fields, dissemination of scientific information and enhancement of communication on scientific matters.

A number of private organisations from time to time provide advice to government on specific matters relating to science and technology. Examples from the business sector are the Australian Chamber of Manufactures, the Business Council of Australia and the Confederation of Australian Industry. Other organisations with an interest in scientific and technological issues include trade unions, industry groups with an interest in specific technologies and individual private organisations.

As performers of research and experimental development, private organisations in Australia are making an increasingly important contribution to Australia's R&D effort. Private business enterprises, for instance, spent an estimated \$818m on R&D in 1985-86, a figure which, whilst still relatively low compared with the spending of comparable OECD countries, represents an increase of 26 per cent over 1984-85 expenditure. Private non-profit organisations in 1985-86 spent \$47m on R&D, the majority of it on health related research.

## Statistics on science and technology

### Expenditure and human resources devoted to research and experimental development

The Australian Bureau of Statistics' Surveys of Research and Experimental Development provide comprehensive data on research and experimental development activities in Australia by organisations in the business enterprise, general government, higher education and private non-profit sectors. They also provide some data on other innovative activities, such as technical know-how payments and receipts and patenting activity. Activities not covered by the survey include scientific or technological services, extension services, education and training, etc.

The first comprehensive survey on R&D was carried out for the financial year 1968-69. There have been five major surveys since then, the latest for which comprehensive results are available being in respect of 1984-85 (1984 calendar year for the Higher Education Sector). Less detailed data in respect of 1985-86 are available from the smaller 'inter year' R&D survey conducted by the Bureau.

The estimate of gross expenditure on R&D (GERD) carried out in Australia, as derived from the results of the 1984-85 survey, is \$2,408m. This represents a 54 per cent increase compared with the 1981-82 survey. At constant (1979-80) prices, GERD increased by 19 per cent over the same period. The total estimate of human resources devoted to R&D during 1984-85 in Australia was 51,000 person years; this represented a 13 per cent increase compared with the previous survey.

See *Year Book* No. 70 for a detailed description of survey methods and concepts.

#### Definitions

The survey's definitions follow guidelines described by the OECD for national R&D surveys. The OECD defines R&D as comprising 'creative work undertaken on a systematic basis in order to increase the stock of knowledge, including knowledge of man, culture and society, and the use of this stock of knowledge to devise new applications'. The Bureau provides sector specific definitions which clarify the OECD definitions for respondents and users (see ABS catalogue 8112.0).

#### Survey results

A summary of results for 1968-69 is given in *Year Book* No. 60. Results for the second survey, 1973-74; the third survey, 1976-77; the fourth survey, 1978-79; and the fifth survey, 1981-82 are given in *Year Books* No. 61, 64, 67 and 70 respectively.

A summary of results from the 1981-82, 1984-85 and 1985-86 surveys is presented below.

#### RESEARCH AND EXPERIMENTAL DEVELOPMENT CARRIED OUT IN AUSTRALIA: HUMAN RESOURCES DEVOTED TO R&D BY SECTOR (person years)

### Business enterprise sector

The estimate of expenditure on R & D carried out in Australia by private and public business enterprises during 1985-86 is \$921m at *current* prices. This represents a 25 per cent increase in expenditure compared with 1984-85. At *constant* (average 1979-80) prices, R & D expenditure is estimated to have increased by 17 per cent over the same period.

## Expenditure by Commonwealth Government organisations on science and technology

The Commonwealth Department of Industry, Technology and Commerce conducts the annual Science and Technology Statement Collection which obtains expenditure data on R&D and broader scientific and technological activities. The collection covers Commonwealth Government organisations (including public business enterprises) and includes expenditure on both intramural (inhouse) activity and R&D extramural funding (grants, contacts etc.).

Latest published results show total Commonwealth Government S&T expenditure in 1986-87 to be \$74,899m. Of this, total R&D expenditure was \$1181.7m (\$728.4m intramural, \$453.3m extramural).

The table below gives an overview of 1986-87 R&D expenditure by the Commonwealth, classified by socio-economic objective.

### TOTAL COMMONWEALTH GOVERNMENT EXPENDITURE<sup>(a)</sup> ON R&D BY SOCIO-ECONOMIC OBJECTIVE, 1986-87 (\$ million)

(a) Excludes expenditure by Commonwealth Government organisations funded from recoveries and external sources such as industry and State Government. Also excludes recurrent funding for Higher Education Institutions and the costs to the Commonwealth of tax incentives. (b) Sum of intramural plus extramural expenditures.

## General government sector

The estimate of expenditure on R&D carried out in Australia by organisations in the general government sector during 1985-86 was \$1,044 million at *current* prices. This represents a 9 per cent increase in expenditure compared with 1984-85. At *constant* (average 1979-80) prices, R&D expenditure is estimated to have increased by 3 per cent over the same period.

## Higher education sector

The estimate of expenditure on R & D carried out in Australia by higher education organisations (excluding CAEs) during 1985 is \$708m at *current* prices. This represents a 6 per cent increase in expenditure compared with 1984. At *constant* (average 1979-80) prices, R & D expenditure is estimated to have decreased by 1 per cent over the same period.

### Statistics on manufacturing industry technology

The level of technological development in manufacturing industry can be viewed by classifying industries to high, medium and low technology according to the intensity of their R&D effort. Using the OECD classification by this method, high technology industries are defined as those manufacturing establishments classified to aircraft (Australian Standard Industrial Classification [ASIC] Class 3244). Communications and other electronic equipment (ASIC Classes 3351 and 3352); electrical appliances and machinery (ASIC Classes 3353-3357); pharmaceutical and veterinary products (ASIC Class 2763); and photographic, professional and scientific equipment (ASIC Group 334). Medium technology covers chemicals (apart from ASIC Class 2763); petroleum and coal products; non-ferrous metals and basic products; motor vehicles and parts, railway equipment and other transport equipment (ASIC Class 3245); industrial machinery; rubber and plastic products; and, other manufacturing (ASIC Group 348). Low technology covers food, beverages and tobacco; textiles, clothing and footwear; wood and wood products; paper and paper products, etc.; petroleum refining; non-metallic mineral products, basic iron and steel products; fabricated metal products; ships and boats; and, leather products.

The figure below shows that high technology industries as a group showed only modest current price growth in turnover in the four year period from 1980-81 to 1984-85 (31 per cent). Low and medium technology groups have performed comparably with four year growths of 31 per cent and 38 per cent respectively. In constant prices terms, total manufacturing industry turnover has shown little growth (1 per cent over the four year period).

The following figure shows a downturn in manufacturing industry employment levels (net drops over the four years of 13 per cent, 12 per cent and 11 per cent for high, medium and low technology industries respectively). Data for the latest year available (1984-85) show modest rises over 1983-84 (1.0 per cent, 1.2 per cent and 0.4 per cent for high, medium and low technology industries respectively).

### Trade statistics

Another way of viewing Australian manufacturing industry's level of technological development is to look at trade of high technology products. Products are classified initially according to commodity (Australian Import and Export Commodity Codes) but converted to an ASIC basis. Definitions of high, medium and low technology groups according to ASIC are the same as above.

The current price value of exports of Australian manufactures is increasing for all groups but most of all for low technology products (17 per cent increase between 1984-85 and 1985-86 compared to 9 per cent and 10 per cent for medium and high technology products respectively), as shown in the figure below.

Current price export growth over the four year period 1980-81 to 1984-85 is, in contrast, highest for the high technology group (65 per cent compared with 62 per cent for medium and 13 per cent for low technology).

The figure below shows that the current price value of total imports of manufactured goods has increased more than exports over the period 1984-85 to 1985-86 (20 per cent compared to a 13 per cent increase for the total current price value of exports). The highest increase was for high technology products (27 per cent compared with 24 per cent and 10 per cent for medium and low technology products respectively).

Over the four year period 1980-81 to 1984-85 the value of imports of high technology goods has increased the most (95 per cent compared to 62 per cent and 42 per cent for medium and low technology goods respectively).

The sudden devaluation of the Australian dollar in 1983 will have contributed to some extent to the rise in the value of imports. To a lesser extent perhaps, it can be expected that the value of exports will continue to rise in the future due to the relatively low value of the Australian dollar.

EXPORTS OF MANUFACTURES, AUSTRALIA

IMPORTS OF MANUFACTURES, AUSTRALIA

### **Other activities**

For information on other activities related to science and technology, see *Year Book* No. 70. That edition contains information on scientific and technological information services (page 640), social science and humanities research (page 652) and international activities (page 653).

### **Additional information**

Additional information on topics presented in this chapter may be found in the annual reports of the organisations mentioned, particularly the Department of Industry, Technology and Commerce, the CSIRO, the Australian Nuclear Science and Technology Organisation, the Department of Defence, and in the annual *Science and Technology Statements*. Statistical information on R&D for the years 1968-69, 1973-74 and 1976-77 may be found in the reports published by the (then) Department of Science on Project SCORE. Statistical information on R&D relating to 1978-79, 1981-82, 1984-85 and 1985-86 may be obtained from the Australian Bureau of Statistics (ABS). Further statistical information on higher education is obtainable from the Commonwealth Tertiary Education Commission. Trade and industry operations data are available from the ABS.

The Department of Industry, Technology and Commerce *Australian Science and Technology Indicators Report*, published in 1988, gives a good overview and analysis of science and technology information in Australia by the use of S&T indicators. It presents information on R&D effort and expenditure, science and technology workforce, S&T information resources, scientific equipment and facilities, literature-based S&T measures, patent activity, technology training, financial support for technological development, industry operations and trade by level of technology, and transfer of technical knowledge.

## SCIENCE AND TECHNOLOGY IN AUSTRALIA

*(This special article has been contributed by the Commonwealth Scientific and Industrial Research Organisation—written by Graeme O'Neill)*

Several lines of evidence indicate that by 60,000 years ago, a coastal culture from the Indonesian archipelago developed a sailing craft capable of undertaking short ocean voyages. From this culture came the ancestors of Australia's Aboriginals. Uniquely, the colonisation of Australia demanded the use of maritime technology—the world's other inhabited continents were all colonised via overland routes. No direct overland connection has ever existed between Australia and the Indonesian archipelago; the smallest gap even at times of low sea level was at least 70 kilometres. Thus, the presence of humans in Australia some 50-60,000 years ago can only be explained by their use of boats or rafts.

In time, these early marine technologists made a successful transition to a hunter-gatherer existence, and developed a unique hunting weapon, the boomerang, with aerodynamic principles that anticipated the curved aerofoil wing that millennia later would permit man himself to take to the air. Aboriginal technologists also developed the woomera, a mechanical throwing device based on the lever, which enabled a spear to be thrown with much greater force and accuracy than by the human arm alone. They also developed tools for making fire at will, and employed fire to modify the environments in which they hunted, and as an aid to hunting itself. And although Aboriginal cultures never studied their environments in a scientific sense, they understood the world around them with an intimacy that has not yet been achieved by formal scientific study.

Australia's geographic isolation and harsh environment demand innovation; the technological achievements of the continent's original colonisers were an impressive response to adversity. It cannot be claimed that innovation began with the arrival of the continent's first European colonists 200 years ago; the scientific and technological achievements of Australians during those two centuries must be seen as part of a 60,000-year continuum of human progress, impelled by isolation and environmental adversity.

Indeed, the efforts of Australia's first British colonists to transplant agricultural systems evolved for temperate Europe's climate and fertile soil proved a failure in the warmer, drier climate and poor soils of the Hawkesbury region. English winter wheats were poorly adapted to such conditions and susceptible to disease, and yields were poor. The wheat industry, which today dominates Australian agriculture, limped on throughout the greater part of the 19th century. It took an historic confluence between a scientific revolution and a scientific genius in the 1880s to establish it as a major force in the Australian economy. Amid scepticism from his peers and the community, William Farrer, former Oxford mathematics wrangler, showed that systematic breeding principles could be applied to improving and adapting wheat to Australian conditions. Farrer bred rust-resistant varieties, but his more important achievement was to develop earlier-maturing varieties like 'Federation' which, by avoiding the worst heat of summer, enabled the wheat industry to expand out of the cooler, wetter highlands into the broad, drier plains of the inland. By the second decade of the 20th century, the wheat industry was booming. Although the genetic legacy of Farrer's wheats has been diluted, the systematic, scientific approach to breeding, which he was among the first in the world to exploit, remains his monument. It set a pattern for wheat breeding that is still used in Australia's wheat breeding institutions today.

Australia's other great agricultural industry, wool-growing, had its genesis soon after the founding of the colony. Captain John Macarthur, the Reverend Samuel Marsden, William Cox and Alexander Riley imported a number of Spanish Merino sheep. Macarthur and Marsden were probably the most prominent figures in developing an improved merino strain yielding an exceptionally fine, high-quality wool. The wool industry boomed. By the early 1890s, sheep numbers had reached a peak of 100 million but then went into sharp decline, particularly in drier regions, due to the impact of overgrazing on native pastures, drought and competition from introduced rabbits. Australian scientists have continued to grapple with these problems during the 20th century with mixed success.

Innovation in Australia during the 19th century was largely the domain of the individual; given the central importance of agriculture, grazing and minerals—chiefly gold—to the colony's economy, it was in these areas that Australians displayed their greatest inventiveness.

Some inventions were bizarre, others highly practical. The stump-jump plough, invented by Robert and Clarence Smith in 1876, enabled cultivation of mallee lands that had previously proved untillable because of the huge sub-surface mallee roots left after surface growth had been removed.

In 1877, Frederick Wolseley patented on the world's first mechanical shearing equipment, whose basic design still edures in modern shearing sheds. Another durable invention was James Alston's unique Australian windmill, used to pump artesian water for livestock in arid areas.

In 1884, 19 year old Hugh McKay demonstrated a prototype of his wheat stripper-harvester, which became the first commercially successful machine capable of stripping, threshing, cleaning and bagging wheat in one continuous operation. By 1902 McKay was exporting harvesters, mainly to Argentina.

In the 1890s, Christian Koerstz developed a cheap wool press which could be operated by two men, allowing even small graziers to build their own wool sheds, where previously they had taken their sheep to large landholders for shearing.

The same year saw Australian veterinary scientists develop a vaccine against anthrax after a successful visit by one of Louis Pasteur's staff—an early example of the extensive international exchanges that have so benefited 20th century Australian science and technology.

Australian research during the 19th century was focused on the natural sciences. The richness of Australia's unique flora and fauna was hinted at by the first formal collections of plants, animals and insects by Joseph Banks and Daniel Solander, naturalists with Captain James Cook's *Endeavour* expedition to the east coast in 1770. This was confirmed by a succession of explorer-naturalists and botanists, chiefly of British origin. Robert Brown, naturalist on Mathew Flinders *Investigator*, during its Admiralty expedition to Australia in 1801, collected more than 3,000 plant specimens. The first part of his *Prodromus Florae Novae Hollandiae et Insulae Van-Dieman*, published in 1801, revolutionised botanical classification, and its insights into the anatomy, physiology and function of Australia's plants stimulated interest in the new science of geography. John Gould studied and painted many of Australia's birds and animals in 1838-40 and Joseph Hooker investigated the flora of Tasmania and in his *Flora Tasmania*, published in 1859, discussed its biogeography in terms of the new theory of natural selection propounded by Charles Darwin. Darwin himself had visited Australia in 1836 as the *Beagle* made its way home from its voyage to South America and the Galapagos Isles.

German-born botanist Baron Ferdinand von Mueller, who was appointed Victorian Government botanist in 1853, travelled throughout south-eastern Australia developing a formidable collection and knowledge of Australia's flora. He published 800 papers and many books and was left embittered when the task of writing the first *Flora Australiensis* went to eminent British botanist George Bentham. Bentham drew heavily on von Mueller's data, but never visited Australia himself.

Astronomy, the science which was ultimately responsible for Australia's colonisation (the *Endeavour* had journeyed to Tahiti to allow scientific observations of the transit of Venus across the face of the sun in 1796), was also a significant research activity in Australia. Southerly latitudes and clear skies offered a much richer vista of the universe. Sir Thomas Brisbane, Governor of New South Wales in 1821 and who in the same year became president of the Philosophical Society (forerunner of the Royal Society of New South Wales), was a keen amateur astronomer. He brought with him the best available astronomical instruments and two expert astronomers, Carl Rumker and James Dunlop. Brisbane built a small observatory at Government House in Parramatta which rapidly gained an international reputation. Among its achievements was the first observation of Encke's comet in 1822.

John Tebbutt's astronomical observations from 1854 onwards led to the discovery of several more comets, as well as several double stars and variable stars, and several new satellites of Jupiter. From such beginnings, Australia developed a reputation in international astronomy which has been continued in modern times by the achievements of its optical and radio astronomers.

One of Australia's most brilliant scientists, but one who received little recognition in his time, was British-born Lawrence Hargrave, inventor of the box kite, who developed a theory of aeronautics based upon his experiments with kites and model aircraft. He discovered that wings with curved surfaces gave twice the lift of flat wings, and that a tail plane gave added stability to his model aeroplanes. Both principles were of fundamental importance to the development of flight. Hargrave also developed a workable radial rotary airscrew engine which formed the basis for the first engines used in European aircraft in the 20th century.

Henry Sutton, a music shop proprietor, designed a continuous current dynamo as early as 1870, constructed as many as 20 different types of telephone at the same time that Alexander Graham Bell was achieving recognition for his invention of the telephone in America. During the 1870s, Sutton carried out experiments with heavier-than-air materials for flight.

Australia's first university, the University of Sydney, had been founded in 1850, but did not establish a separate science faculty until 1879. Melbourne University was founded in 1853, Adelaide University in 1874, and the University of Tasmania in 1889.

By the late 19th century, Australian science had developed considerable momentum. Royal Societies or Philosophical Societies existed in all the eastern States by 1884, and university researchers were making important contributions to international science and technology, principally in the area of fundamental studies. Horace Lamb, who became the first Professor of Mathematics at Adelaide University a year after it was established in 1874, was later elected a Fellow of the Royal Society for outstanding research into the motion and properties of fluids. Melbourne University chemist, Professor David Masson, was also elected to the Royal Society for his fundamental work on the constitution of atoms and his theory of the dissociation of electrolytes in water.

The steady expansion of agriculture in Australia confronted the industry with a range of environmental and agronomic problems. Additionally, crops and animals that had been selected for northern hemisphere conditions performed relatively poorly in Australia. The need for scientific study of agriculture was realised, and in 1885, Roseworthy Agricultural College was founded in South Australia to teach the principles of agriculture and to investigate its problems. Victoria's Dookie Agricultural College was founded a year later. N.S.W.'s Hawkesbury Agricultural College was founded in 1891; that same year a horticultural college was founded in Victoria.

Australia's geology was very different from that of other countries; there was lively debate over the age of the continent, and the discovery of major mineral deposits during the 1800s provided economic incentive for geological research and exploration. The State governments sponsored geological and mineralogical surveys which, in addition to discovering mineral deposits, also yielded geological, mineralogical and topographical maps upon which renewed mineral exploration in the 20th century was based.

Australia's minerals industry traces its beginnings to the 1797 discovery of coal on the banks of the Hunter River, as well as at Coalcliff 65 km south of Sydney. The mining technology of the day was inadequate to extract the coal; Australia's distinctive geology has continued to pose special problems for mining operations, and throughout the 1800s required the development of innovative mining techniques for important minerals. By the late 1800s, gold, tin, copper, silver, lead and zinc orebodies were being mined, often at considerable depth, where hazards to miners were great. Australia was the world's largest producer of gold, and at Bendigo, novel deep-drilling techniques had been developed which permitted recovery of ore from considerable depths, at a time when most gold mines were still extracting gold from basically alluvial sources. Research for safer and more efficient mining techniques continues today.

Mineral extraction techniques evolved; the bromo-cyanide process for gold extraction was first demonstrated at Kalgoorlie to recover gold from telluride ores in 1899 and the world's most important mineral extraction and separation technique, the flotation process, was first developed on a commercial scale in Australia by Charles Potter, a Melbourne brewer and chemist. Potter's process, patented in 1901, employed a late 18th century discovery that powdered mineral ores particles could be brought to the surface and suspended by attaching to bubbles passed through ore-charged liquids. First used at Broken Hill in 1901, Potter's flotation process initially yielded a collective aggregate of silver, lead and zinc, but later developments, some of them arising from fundamental studies, saw the flotation process progressively refined to the point where lead, zinc and many other commercially important minerals could be floated out selectively.

### **Science and technology in 20th century Australia**

With Federation in 1901, and with the Australian economy evolving rapidly in diversity and complexity, the administration and funding of science in Australia took on a more systematic pattern, chiefly because of the increasing involvement of the new Commonwealth Government. In time, it would become the major sponsor of Australian science and technol-

ogy, giving it the cohesion and direction that had been absent in the previous century. Australia's traditional reliance upon agricultural and mineral exports saw both government and private industry research focused in these areas, a pattern which was to predominate until recent times.

Australia's fifth university, the University of Queensland, was the first university established in the 20th century, in 1910; Western Australia became the last State to establish a university, the University of Western Australia, in 1913. By the 1980s, Australia had 19 universities—Sydney and Melbourne each have three, Brisbane, Adelaide and Perth each have two, Hobart has one and there are universities in the Australian capital, Canberra, and the major provincial centres of Geelong, Armidale, Townsville, Newcastle and Wollongong.

Australia's universities have made important contributions to international science and technology. In 1907, Professor O. U. Vonwiller of Sydney University showed that amorphous selenium would conduct electricity induced by light, anticipating the development of the modern photocopier. In 1928, E. J. Hartung of Melbourne University showed that the photographic paper darkened when exposed to light because silver chloride decomposed, giving off chlorine and precipitating silver.

In the first half of the 20th century, universities concentrated on their educational role. Their links with industry were oriented mainly towards agriculture and mining, and interaction with manufacturing industry was at a low level.

In 1926, the Commonwealth established the Council for Scientific and Industrial Research (CSIR), progenitor of the Commonwealth Scientific and Industrial Research Organisation. CSIR's early work focused on research for agriculture which, as the economic impetus of great gold rushes of the latter half of the 19th century ebbed, had become the mainstay of the economy. Agriculture was centred on wheat and grazing; wool had been established as a major export the previous century, and after a faltering start, the wheat industry was prospering from the legacy of breeders such as Farrer.

CSIR's early work was constrained by limited resources but gradually it built up individual research programs, and then specialised research divisions, studying animal health and nutrition, soils, economically-significant plants, fisheries, food preservation and transport. Not until 1936 did the Australian Government decide to extend CSIR's activities into secondary industry. It proved a timely decision, providing a springboard for the development of industries that strengthened Australia's effort during World War II.

During the War three new divisions were formed, dealing with dairy research, radiophysics, and lubricants and bearings—the latter became the Division of Tribophysics (surface physics). Some of CSIRO's most significant achievements, even to the modern day, trace back to the wartime establishment of these divisions.

One of the most important developments in CSIR was the establishment of a National Standards Laboratory in 1939 to administer and refine standards of measurement, as well as to calibrate the measurement tools of Australian industry. It underpinned the contribution of manufacturing industry to the war effort.

In the same year, CSIR began a top-secret radar project in a laboratory at Sydney University, which later allowed the deployment of a transportable radar system in the Pacific war theatre.

In 1947, man-made rain fell for the first time in Australia, and probably in the world, when a CSIR aircraft seeded clouds over the Blue Mountains with silver iodide. Research into rainmaking was finally discontinued in 1981 after it was concluded that no useful increase in rain could be produced by cloud seeding, a finding which itself produced controversy.

In the years immediately after the War, a debate arose over potential conflict between CSIR's need for scientific freedom, and the preservation of national security. The Science and Industry Research Act of 1949, which formally established the Commonwealth Scientific and Industrial Research Organisation (CSIRO), resolved the issue by specifically precluding its involvement in secret or classified research of a military nature.

CSIRO's management was now conducted by a small Executive, instead of the council that had guided CSIR. The Executive's first chairman was Ian Clunies Ross (later Sir Ian), whose vision of the potential contribution of scientific research to Australia's development, alloyed with his exceptional skills as an advocate and lobbyist for science, was primarily responsible for a remarkable decade of expansion and diversification of the Organisation from 1949 to 1959.

In 1945, CSIR had established a Division of Radiophysics to study the sun. By the 1950s, CSIRO led the world in radioastronomy, and in 1961 began studies of the radio universe with one of the world's largest radiotelescopes at Parkes, New South Wales. The instrument, which in enhanced form is still in use today, has yielded important discoveries about the evolution of the universe. Among other things, it has located half of the known pulsars—rapidly rotating remnants of stars destroyed by supernovas—and has identified complex organic molecules in space which could have been building blocks for life. From the mid-1960s, it served as a powerful primary receiver for transmissions from US spacecraft, relaying Mans' first words from the moon, and playing major roles in the dramatic rescue of the astronauts aboard the ill-fated Apollo 13 mission and the tracking of the Giotto space probe to Halley's Comet in 1986. CSIRO's new Australia Telescope, an array of radio antennae incorporating the Parkes radiotelescope, is due to be completed during 1988. It will have equivalent power to a radiotelescope 300 km in diameter, and will be capable of mapping the furthest reaches of the universe.

The Division of Radiophysics has made two outstanding contributions to air navigation technology; firstly with the development of the Distance Measuring Equipment system, based on triangulation with radio beacons, and secondly, with Interscan, a microwave-based landing system that allows aircraft to locate their position in three-dimensional space with great precision under all weather conditions. Interscan allows a choice of widely-varying landing approaches to be chosen, helping to minimise noise pollution and greatly increasing the flexibility and safety of air traffic control. In 1978 the International Civil Aviation Organisation selected Interscan as the international standard for aviation landing systems to serve into the 21st century.

The three decades after World War II saw CSIRO establish a reputation for excellence in research in many fields. A huge rabbit plague had developed during the war years, and was having a disastrous effect on the productivity of grazing land. CSIRO imported a virus for the rabbit disease myxomatosis, which after initial failure, took hold in Victoria in 1950 and killed millions of rabbits.

In 1952 CSIRO scientist Alan Walsh developed the atomic absorption spectrometer, a device capable of rapidly analysing the chemical constituents of materials as diverse as mineral samples, human blood or polluted water. Described as the greatest advance in chemical analysis this century, the atomic absorption spectrometer has saved mineral exploration companies millions of dollars by performing in minutes complex chemical analyses that had once taken many days.

So extensive and diverse are CSIRO's research activities that any account of its achievements is necessarily eclectic. Other significant advances in the post-war decades include:

- Partially-stabilized zirconia (PSZ), described as the world's toughest ceramic;
- A new generation of safe, potent insecticides called insecticidal esters, based upon fundamental studies of the interaction of chemical molecules with insect nerve membranes. Insecticidal esters will not persist in the environment and have very low toxicity to other animals;
- Biological control of skeleton weed during the 1960s, and siren wood wasp in pine plantations in the 1970s. More recently, a highly successful biological control program against the world's worst water weed, the floating fern *Salvinia*, in Australia, Papua-New Guinea and several Asian and African nations. *Salvinia* is expected to be reduced to an insignificant economic problem around the world by the 1990s;
- SIROTEM, a new electromagnetic device which allows hidden sub-surface orebodies to be detected at depths up to 300 m;
- Advanced satellite image-analysis techniques, which have revolutionised strategic exploration for minerals, allowed large-scale mapping of Australia's environments, and permitted monitoring of the development of crops;
- A computerised system for managing cotton and its pests, based on an understanding of how the crop develops and of the life cycles of pests and their natural predators;
- Several advanced methods of purifying water, based on ion-exchange resins or tiny magnetic beads which selectively remove salts and other impurities;
- Genetically engineered animals. CSIRO produced Australia's first genetically-engineered sheep in 1986. The technique ultimately promises sheep which will grow faster and larger under the influence of an extra growth hormone gene in their cells;
- A vaccine which promotes twin births in sheep, accelerating productivity for the fat lamb industry;

- Genetic engineering of plants. CSIRO produced Australia's first genetically engineered plant in 1985, and is now working to produce genetically engineered cereals;
- A technology for custom-designing computer chips containing more than 100,000 transistors. The technology allows research institutions and industry to design chips for specialised applications in scientific devices or high-technology manufactured goods;

Other Commonwealth instrumentalities, universities and other education institutions, medical research centres, State research bodies and, to a lesser extent, private industry, have provided the warp to CSIRO's weft in the fabric of Australian science and technology. Some of their achievements in recent decades include:

- Development of a new high-efficiency solar cell by the University of NSW, employing a simpler metal-insulator semiconductor system;
- Melbourne University's 'bionic ear', an implant for the totally deaf, which analyses sound and encodes it for detection by the brain;
- A new process for producing ethanol by fermentation, using the bacterium *Zymomonas mobilis*, instead of yeast, developed by the University of NSW;
- The identification and isolation by the Australian Institute of Marine Science of a natural agent that protects corals from damaging ultra-violet radiation. The compound has potential uses in commercial sunscreens, and in weathering-resistant paints and plastics;
- Commercial development and release by a private company, Biotechnology Australia, in 1986 of Australia's first genetically-engineered vaccine for use against lethal diarrhoea in piglets;
- Development by Comalco of a highly durable lightweight aluminium alloy, called 3HA, suitable for use without steel liners in alloy engine blocks, as well as in diverse applications involving high strength aluminium castings;
- A new type of automotive engine, employing an orbital motion, developed by the Perth-based private inventor, entrepreneur and engineer, Ralph Sarich, and developed by his company. The new engine has considerably fewer moving parts than any existing automotive engine, and delivers equivalent power from a much smaller size. Sarich has also developed a revolutionary new fuel injection system; both inventions are approaching commercial release;
- The Jindalee over-the-horizon radar system, developed by the Defence Science and Technology Organisation, which bounces transmission off the ionosphere, allowing targets hundreds of kilometres off Australia's north-west coast to be detected;
- Synroc, a synthetic composite mineral for the safe, long-term immobilisation and storage of radioactive wastes, developed by the Australian National University;

### Medical science in the 20th century

At the time of Federation, the States ceded many functions to the Commonwealth, but preserved their responsibility for the health of their communities. As a result, many of Australia's medical research institutions are administered by their respective States, or in conjunction with the Commonwealth. However, most derive a significant part of their research funding from the Commonwealth, principally from the National Health and Medical Research Council, or from various private foundations such as the National Heart Foundation and the various State Anti-Cancer Councils. Under this system, medical research has flourished and Australia enjoys an international reputation for excellence in many fields. Some of the important achievements of Australian medical research include:

- Australian researcher Priscilla Kincaid Smith was one of the first to recognise the link between indiscriminate use of analgesics and a high incidence of kidney damage;
- Although the first birth resulting from in-vitro fertilisation occurred in England, Australia has become pre-eminent in the treatment of human infertility and has a higher success rate than any other country in the world, due largely to the pioneering work of Professor Carl Wood and his associates at Monash University;
- Researchers from Melbourne University and the Royal Children's Hospital in the early 1970s established that rotaviruses were the most important single agent responsible for infantile diarrhoea in both developed and developing nations. Research is in progress to develop a genetically engineered vaccine;
- In collaboration with the Australian National University, CSIRO has determined the structure of one of the key proteins of the influenza virus, and is working with ANU to develop a drug to treat influenza, as well as a synthetic vaccine;

- The Walter and Eliza Hall Institute's recent development of a prototype vaccine against malaria, from basic studies of the antigenic components of the protein coat of the malaria parasite. An estimated 300 million people around the world suffer from malaria, and an effective vaccine would represent one of the most important developments of 20th century medical science;
- Adelaide University's development, via genetic engineering, of a prototype oral vaccine against cholera and typhoid, two other major diseases in developing nations;
- A synthetic human growth hormone, developed by Sydney's Garvan Institute of Medical Research, the University of N.S.W. School of Biotechnology, and California Biotechnology, which could provide a safe treatment for hereditary dwarfism.

### **The future of Australian science and technology**

The future of Australian science and technology appears bright. The nation has no shortage of original thinkers, as attested to by the volume of Australian research papers contributed to the international scientific literature, particularly in areas of fundamental knowledge. That very strength, however, hints at a chronic problem—the low rate at which original ideas are translated into practical applications, or into marketable products or processes that can be marketed within Australia and overseas.

The underlying reasons are historic; most Australian companies were small by overseas standards and could not sustain their own in-house research programs. In the post-War years, Commonwealth Governments actively encouraged multi-national companies to establish subsidiaries in Australia, as a means of diversifying the economy and providing employment, but a penalty in this approach was that such companies were able to rely upon imported technology and ideas from their overseas parents. Some even absorbed progressive local companies, with adverse effect on the level of private research and development.

In the past three decades, the level of privately sponsored research and development declined to one of the lowest levels of any Western nation. There has been little economic pressure to innovate or to maintain technological parity with overseas manufacturers. As a consequence, privately sponsored research stagnated and declined. Until quite recently, Australia's need for foreign exchange has been satisfied by international markets for wheat, wool and minerals, and manufacturing industry fell behind its counterparts in Europe and the United States—not only in its level of involvement in export markets, but in the production technologies it was employing, so that its efficiency declined as well. By the late 1970s, with international export markets for agricultural produce and raw materials declining, and dominated increasingly by manufactured, high-technology goods, the imbalance in Australia's economy was increasingly apparent, and the need to restructure and reorient science and technology towards the task of improving manufacturing industry's performance had become imperative.

Historians may argue that Australia failed to heed the first major warning of the vulnerability of its economy to changes in the marketplace. In the 1950s a new generation of synthetic fibres began to erode markets that had traditionally been dominated by wool. In an intensive research effort from that time onwards, CSIRO studied the biological, biochemical and physical properties of wool and produced innovations in wool processing and wool treatment, such as permanent-pleat wool garments, shrinkproof wool fabrics, and Self-twist spinning—a faster and more economical spinning technique which revolutionised wool spinning around the world. CSIRO also developed cheaper methods of processing wool and evolved a marketing system based on objective measurement of wool's properties, which had traditionally been assessed by eye and hand. This intensive and comprehensive research and development program maintained wool's reputation as the premier fashion fibre in world markets, where the industry might easily have foundered in the 1960s, with disastrous effect upon the Australian economy.

In the past few years Australian research institutions have begun to pay increasing attention to the commercialisation of their research. CSIRO, a number of universities, and private medical research centres have individually or jointly established their own commercial companies. Medicine, veterinary science and agriculture, the historical strengths in Australian research, seem destined to play an important role in Australia's economic future.

Australian scientists and technologists are contributing to the spectacular international growth of information technology, through the development of innovative computer hardware

---

and software, networking systems, and advanced information storage and retrieval systems. Information technology is a growth industry that provides marketable commodities in its own right, but its greater contribution may be as a catalyst for the advancement of existing industries in Australia, which are showing encouraging signs of exploiting technology to improve their production efficiency, and to develop innovative products for local and export markets. It also provides a means of gaining access to a vast pool of information and ideas held in international data bases and overseas laboratories. Australia's substantial and continuing contribution to this pool has given it reciprocal rights to employ the information to its own advantage; the nation's prosperity during the next two centuries will be founded on the sharing of information with the international community, its own continuing intellectual vigour and a resurgence of the enterprise and industrial dynamism that characterised its earlier years.

## CHAPTER TWENTY-THREE

### PRIVATE FINANCE

---

This chapter contains a special article on the deregulation of the Australian financial system, as well as statistics on the activities and structure of financial institutions including banks, building societies, insurance companies, finance companies, credit unions and co-operative societies together with descriptions of their operations and relevant controlling legislation.

#### DEREGULATION OF THE AUSTRALIAN FINANCIAL SYSTEM

##### Introduction

Since 1980 the Australian financial system has been transformed from a highly regulated and closed system into a more open and competitive one. The process of deregulation has advanced under successive federal governments. Underlying this process has been the belief that the financial markets would operate more efficiently if there was a minimum of government intervention. This article gives a brief resumé of the major events in the process of deregulation of the Australian finance system.

##### The financial system prior to 1980

The financial system regulations in operation by the late 1970s evolved from the war-time banking controls established in 1941. They were designed primarily to control the activities of the banks; non-bank financial institutions (NBFIs) faced little regulation until 1974. Generally, the NBFIs had developed in response to the inability of the regulated banks to provide certain services and facilities. Regulation of NBFIs came in 1974 with the enactment of the Financial Corporations Act which imposed certain requirements on NBFIs in respect of reporting and liquidity.

The banks were extended the privileges of having exclusive access to the cheque clearing system and to foreign exchange dealings, along with the guarantee of lender of last resort facilities from the central bank but, as a result, were subject to close regulation of the terms of their lending and deposit activities. Their asset structures were also regulated by means of investment restrictions, the Statutory Reserve Deposit (SRD) regulation and the Liquid Assets and Government Securities (LGS) convention.<sup>1</sup>

The *Banking Act* (1959) and the *Reserve Bank Act* (1959) were the main legislative vehicles of bank regulation. The Reserve Bank of Australia took over the central banking functions of the former Commonwealth Bank as a result of these Acts. The responsibilities of the Reserve Bank included the implementation and formulation of monetary policy, monitoring the operations of the financial system, and acting as the government's banker. The Reserve Bank was expected to use its powers in such a way as to best contribute to the stability of the currency of Australia, the maintenance of full employment in Australia and the economic prosperity and welfare of Australia.

The NBFIs that emerged in the post-war period included finance companies, building societies, credit unions and merchant banks. Each provided specialist services that the banks could not provide within the regulated environment.

Finance companies were created to service the consumer credit end of the market. Many of these companies were either established by banks as subsidiaries, or were existing companies in which the banks purchased shares (subject to regulated limits on shareholdings by banks

---

<sup>1</sup> The Statutory Reserve Deposit (SRD) regulation requires trading banks to maintain a certain proportion of their deposits in an SRD account with the Reserve Bank. The Liquid Assets and Government Securities (LGS) convention required major trading banks to maintain a minimum set ratio of LGS assets (i.e. notes, coins, cash with Reserve Bank and all Commonwealth Government securities) to deposits.

in finance companies). The finance companies could raise funds by means unavailable to the banks and lend funds on terms and rates unavailable from the banks.

Merchant banks provided such services as money and securities trading (including financial futures); longer-term financing; arranging working capital and finance for projects; advising on take-overs, mergers and foreign exchange cover; underwriting corporate and semi-government securities issues; providing portfolio management. Letters of credit, preference share placements and bill facilities were provided by certain merchant banks. Some of these services were outside the field of operations allowed to banks by the banking regulations.

Most banks established merchant banks as subsidiaries. This meant that the banks were not totally excluded from providing these types of financial services. Foreign banks were major participants in merchant banking. This provided foreign banks with a major vehicle by which they could participate in the finance market in Australia.

Notwithstanding that the banks often owned substantial shares of these NBFIs, the banks faced stiff competition for funds. The NBFIs were able to offer higher returns, and take commensurately higher risks, than the banks. In addition, the terms on which funds were lent by the NBFIs were more flexible and this too provided significant competition for the banks.

The Financial Corporations Act was enacted to allow the government, through the Reserve Bank, means to examine and regulate the activities of the NBFIs. This was to take place having regard to the matters of 'economic stability, the maintenance of full employment, the efficient allocation of the productive resources of the economy, the ensuring of adequate levels of housing finance and the economic prosperity and welfare of the people of Australia'.

The Reserve Bank was empowered under this Act to make determinations to ensure that the NBFIs maintained certain types of assets to a specified amount, to establish policies regarding the amount that could be lent and to whom it could be lent and to prohibit the charging or paying of interest above a specified ceiling.

The intentions in regulating financial markets in general were to facilitate the implementation of economic (monetary) policy, protect investors, promote competition and achieve certain social/sectoral policies. Initially, the most significant of these policies related to housing. The aim was to ensure that adequate funds were available at reasonable rates for home purchasers.

By the late 1970s it became apparent, with the increasing competition between financial institutions operating in a highly regulated environment, that the regulations themselves were creating distortions.

The banks were facing increasing pressure in attracting funds because of the relatively lower rates and terms they were permitted to offer to depositors. This meant that they had less funds available for lending for housing in particular. Restrictions as to who could provide deposits also hampered the savings banks' ability to attract funds. Similarly, restrictions on rates charged and the purpose of lending meant that banks were presented with an incentive to direct their lending towards more profitable types of lending—again, often not in favour of housing.

### **The process of deregulation—the banks**

A 'Committee of Inquiry into the Australian Financial System', also known as the Campbell Committee, was established in January 1979 in response to the dissatisfaction of many sections of the Australian community with the existing state of affairs in the financial system. The Committee was to investigate the operations of the total financial system in Australia, not just banking.

The Committee's final report was tabled in Parliament in November 1981. In the meantime an interim report was released in May 1980. The interim report marked a turning point. Following its release the deregulatory process began to gain momentum.

Even before the interim report was released, some changes were being made. In May 1980 the limit on shareholdings by banks in merchant banks was increased. Banks were permitted to hold up to 60 per cent of the shares instead of the previous 33.3 per cent.

In December 1980, after the interim report had been released, most controls imposed on bank interest rates and deposits were removed. The direct result of this action was an immediate increase in the competitiveness of the banks. The relaxing of the controls meant that they were better able to compete with the NBFIs for depositors' funds.

The establishment of the Australian Bank Ltd. was announced in February 1981. This was the first new domestic trading bank in fifty years.

In anticipation that the Campbell Committee would actively support the entry of foreign banks into the Australian system, four of the six major banks sought permission to undertake mergers. In June 1981 the Treasurer gave permission for the merger of the Bank of New South Wales with the Commercial Bank of Australia and the merger of the National Bank of Australasia with the Commercial Banking Company of Sydney. The new banks became the Westpac Banking Corporation and the National Australia Bank, respectively.

The final report of the Campbell Committee recommended extensive deregulation of the financial system. These recommendations included, *inter alia*, that foreign banks should be allowed to operate in Australia either as licenced banks or as agencies of foreign banks, and they should be restricted to an 'off-shore' lending role but unable to borrow in the Australian market or to trade foreign exchange. The Committee also recommended that controls over exchange, deposits and interest rates should be abolished; that the exchange rate be determined by the market; and that there be greater emphasis on the supervision of banks with a minimum of regulation and government intervention.

Arising from these recommendations the restriction on trading bank lending growth was removed in June 1982. Previously it had been restricted to 12 per cent per annum.

In March of the same year, the Treasurer had announced that the requirement to give one month's notice of withdrawal from savings bank investment accounts was to be removed and that savings banks could accept small deposits (under \$50,000) for fixed terms of between 30 days and four years. Trading banks had the minimum term for their small fixed deposits reduced from 3 months to 30 days, and the minimum term for larger fixed deposits (over \$50,000) and certificates of deposit reduced from 30 days to 14 days.

Savings banks' ability to compete for deposits and lending was greatly enhanced after August 1982. The LGS ratio was reduced from 40 per cent to 15 per cent, the banks were permitted to accept deposits of up to \$100,000 from profit-making bodies, and they were permitted to invest up to 6 per cent of their deposits without restriction.

January 1983 saw the announcement that the government had decided to allow the entry of about ten new banks, including foreign banks. Applications for new banking licences were to close on 31 May 1983, but in February this was extended to 30 June 1983.

The establishment of the Martin Review Group was announced in May 1983 to examine the Australian financial system and the Campbell Committee's recommendations. The review was to be conducted in the light of the newly-elected Labor Government's social and economic objectives. The question of new banks was to be deferred until the review was completed.

October 1983 saw the Reserve Bank grant trading banks greater flexibility to hold foreign currency balances. They were also permitted to quote their own foreign currency rates to their customers instead of the rates determined by the Reserve Bank.

Legislation was introduced in the South Australian Parliament in November 1983 which outlined the merger between the State Bank of South Australia and the Savings Bank of South Australia. Both were banks established and guaranteed by the legislation.<sup>2</sup> This merger was a response to the growing level of competition in banking and the finance market generally.

It was announced in December 1983 that the Australian dollar would be free to float on foreign exchange markets. At the same time it was announced that major parts of the exchange controls were to be abolished.

The Martin Review Group presented its report on the Australian financial system in February 1984. The report supported the continuation of the process of deregulation as well as the entry of new banks into the Australian system—by both foreign and domestic interests.

In April 1984 the formation of a new bank by the merchant bank Hill Samuel Australia Ltd was approved. The new bank was called the Macquarie Bank Ltd. It was the second new domestic bank which pre-dated the entry of new foreign banks. The bank commenced operations on 4 March 1985.

In May 1984 the Reserve Bank announced that loans made by banks to authorised dealers and secured by Commonwealth Government Securities, could be included in the banks' LGS ratio. This gave banks greater flexibility in managing this ratio with the aim of them releasing

---

2. Banks established by Acts of State parliaments are not subject to federal banking legislation and regulation as they are guaranteed by their respective State governments. However, they generally comply with the liquidity standards established by the Reserve Bank.

additional funds for credit creation purposes, at least in the short-term.

The Treasurer, in April 1984, called for applications from NBFIs seeking an authority to deal in foreign exchange. In June it was announced that authorities were to be granted to 40 NBFIs. The granting of these authorities ended the exclusive access of the trading banks to this area of the financial system and allowed for much greater competition and choice.

The restriction that trading bank fixed deposits had to be held for at least 14 days was removed in August 1984. Banks could then pay interest on funds held for less than 14 days, including over-night funds. Payment of interest on cheque accounts was also permitted from this time.

The Bank of China had originally begun operating in Australia in July 1942. It returned its licence in 1972. In September 1984 it was announced that the Bank's licence was to be reactivated. This was possible by virtue of the fact that the Bank had originally commenced operations prior to World War II and its licence had never actually been cancelled.

Applications were invited in September 1984 for new banking licences. The deadline was set as 23 November. The new banks were expected to comply with official monetary policy requirements, to follow the prudential and liquidity guidelines, to be locally incorporated and to have a minimum of \$A25m paid up capital. The latter requirement was to ensure that the new banks would be large enough to offer real and immediate competition.

In addition the Government indicated that it would prefer that there be at least 50 per cent Australian equity in the new bank. However, it was also announced that if an applicant could demonstrate that by being granted a licence it would bring substantial benefits to the Australian market, it may be granted a licence with a reduced Australian equity. At the same time the Treasurer announced that the Government intended to adopt another Martin Review Group recommendation and amend the Banks (Shareholdings) Act to permit a 15 per cent maximum equity for any one shareholder in a bank. The existing limit was 10 per cent.

The Government announced in February 1985 that sixteen of the forty-two applications for bank licences had been approved.

Oversea-Chinese Banking Corporation Ltd

The ceiling on interest rates on overdrafts of amounts less than \$100,000 was removed in April 1985. In May 1985 the Reserve Bank introduced the Prime Assets Ratio (PAR) for

the trading banks.<sup>3</sup> The Reserve Bank also outlined what its framework would be for supervising the adequacy of trading bank liquidity in so far as their operations within Australia in Australian dollars were concerned. It made similar announcements concerning foreign currency operations and the holding of assets in Australia bought with the foreign currency, and the extension of the PAR. In September 1985 the foreign investment controls in respect of shareholdings in merchant banks were suspended for an indefinite period.

April 1986 saw the lifting of one of the last remaining interest rate controls. As part of a package designed to assist the housing industry and the banks, the Government lifted the control on housing loan interest rates for loans of less than \$100,000 where those loans were finalised after 2 April 1986. Loans finalised prior to that date remained protected by the former ceiling of 13.5 per cent.

The first of the new banks began operations in September 1985. By the beginning of August 1986 all banks granted new licences, with the exception of J. P. Morgan & Co., had commenced operations.

These deregulatory actions greatly increased the competition between the different banks and between the banks and the NBFIs. This was achieved by allowing banks greater flexibility in the scope of their operations and by allowing additional banks to enter the market. The entry of banks would not have been successful under the former, regulated environment.

Australia now has a banking industry which includes an increased number of banks. As a result Australians have increased access, via the new banks, to foreign markets, while foreign investors have greater access into Australian markets.

### **The process of deregulation—non-banks**

Alongside the changes in banking regulations have been changes in the NBFIs' operating environment. The overall result has been to reduce the pre-deregulation distinctions between the different types of institutions.

As far as the NBFIs are concerned, the process of deregulation has meant that they have either been granted access to areas that were previously the exclusive province of the banks, or existing access has been improved. This has included direct access to foreign exchange markets, direct access by authorised dealers and the newly created reporting bond dealers<sup>4</sup> to the Reserve Bank for dealings in government securities, and the opportunity for many institutions to vary their status. Building societies have been particularly active in the latter area in recent times, several changing their status to savings banks. This has been achieved by way of merger or by simply applying for a change in status.

For example, in February 1985 the N.S.W. Building Society announced that it planned to seek savings bank status. It began operations as a savings bank in June 1985 under the new name of Advance Bank Australia Ltd. The Advance Bank has since merged with the Civic Permanent Building Society to establish the Civic Advance Bank Limited, which commenced its operations in June 1986 and has its headquarters in Canberra.

In addition, a partnership entered into by the Royal Bank of Canada and the National Mutual Life Association resulted in the National Mutual Royal Bank Limited, which commenced operation in February 1986. A subsequent merger by this bank with the National Mutual Permanent Building Society in N.S.W. resulted in the formation of the National Mutual Royal Savings Bank Limited and the National Mutual Royal Savings Bank (N.S.W.) Limited.

A new savings bank, which commenced operations on 21 April 1987, the Perth based Challenge Bank Limited, was established after a merger of the Perth Building Society and the Hotham Permanent Building Society of Victoria.

Building societies and credit unions, in an attempt to increase their competitiveness, have entered into agency agreements with some banks whereby the relevant bank acts as the building society's or credit union's agent at the cheque clearing houses. This has enabled the building societies and credit unions to offer chequeing accounts to their customers. The

---

3. The Prime Assets Ratio (PAR) requires each trading bank to hold at all times 'prime assets' equivalent to not less than 12 per cent of its total liabilities (other than shareholders' funds) within Australia. Prime assets include notes and coins, balances with the Reserve Bank, all Commonwealth government securities, and loans to authorised money market dealers secured against Commonwealth Government securities. The PAR prudential arrangement replaced the previous LGS convention.

4. In November 1984 it was announced that 21 Reporting Bond Dealers were to be established with effect from January 1985. The RBA would deal with this group in Commonwealth Bonds where the period to maturity was greater than twelve months.

clearing houses are owned by the banks and these negotiated agency agreements are the only means available to the building societies and credit unions to offer these accounts to their customers.

Building societies have been granted permission to issue credit cards. This area was previously available only to the banks.

In September 1985 the Government announced that it was setting aside, for a period of twelve months, the existing guidelines for foreign ownership of merchant banks. The decision

### TOTAL ASSETS OF SELECTED FINANCIAL INSTITUTIONS

was taken to allow the merchant banks to become more competitive and to allow new merchant banks to enter the Australian market. It meant, in effect, that they could be 100 per cent owned by foreign investors. By June 1986 there were 30 new merchant banks in the Australian system.

Sharemarkets too have been deregulated. Relaxation of restrictions relating to ownership and incorporation of stock-broking firms and on commissions chargeable to clients, together with the granting of new stock exchange membership, has meant that this aspect of the financial system has been made available to the banks through either partnerships or mergers with broking houses, or by gaining membership themselves of the stock exchanges. Foreign owners have also appeared on the share registers of broking companies as the restrictions on foreign ownership have been gradually relaxed.

## Conclusion

The objective of deregulation was to create an environment where greater competition promoting financial innovation could bring about increased efficiency and fairness within the Australian financial system. While, to the casual observer, there is ample evidence of the changes that have taken place, particularly in the range of customer services offered by the various institutions and in the number of new names in the industry, many of the changes have been too recent to be reflected dramatically in the available statistics.

The graph above illustrates the growth in the assets of selected financial institutions over a period of 16 years. While this graph indicates some changes in the relative importance of different types of institutions, it is not necessarily indicative of future trends, which will depend on how well each type of institution competes in the deregulated environment. As deregulation reduces the institutionalised differences between the various institutions, so will the relevance of this type of comparison diminish.

## MONEY

### Currency

Australia has a decimal system of currency, the unit being the dollar which is divided into 100 cents. Australian notes are issued in the denominations of \$2, \$5, \$10, \$20, \$50 and \$100 and coins in the denominations of 1c, 2c, 5c, 10c, 20c, 50c and \$1. The \$1 note was replaced by the \$1 coin in 1984.

For additional information on note issues and coinage, refer to the List of Special Articles towards the back of this *Year Book*.

### Volume of money

Statistics of the volume of money in the following table include notes and coins in the hands of the public, deposits of the public with trading banks (including the Reserve Bank) and deposits with all savings banks. Volume of money is a measure of specified financial assets held by the non-bank public.

The financial assets included in the volume of money in the table represent only part (albeit a major part) of the public's total holdings of liquid financial assets. An expanded view of the volume of money would include the public's holdings of such other claims as finance company debentures, deposits and shares of building societies, loans to authorised dealers in the short-term money market, government securities, etc.

(a) Excludes deposits of the Commonwealth and State Governments and inter-bank deposits. (b) Excludes holdings of the Commonwealth and State Governments and banks. (c) Interpolated 'weekly average' based on end-of-month figures.

## FINANCIAL LEGISLATION

### Commonwealth legislation for economic management

With Federation in 1901 the new Commonwealth Parliament was given power under Section 51 of the Commonwealth Constitution to legislate with respect to 'Banking, other than State Banking, also State Banking extending beyond the limits of the State concerned, the incorporation of banks, and the issue of paper money'. In 1911 the Commonwealth entered the field of banking with the establishment of the Commonwealth Bank of Australia, which conducted both trading bank and savings bank operations.

From 1911 to 1945 the functions of central banking became more and more the responsibility of the Commonwealth Bank, and in 1945 the Commonwealth Parliament directed it to act as a central bank. In the ensuing period of economic growth and financial development, the need for effective regulatory control of finance through banks became increasingly recognised. During 1959 the Commonwealth Parliament enacted the following legislation:

- (a) The *Banking Act 1959* which applies to all banks operating in Australia, including the external territories of the Commonwealth, except State banks trading in their own State. The objects of the Act are:
- (i) to provide a legal framework uniform throughout Australia for regulating the banking system;
  - (ii) to safeguard depositors of the banks from loss;
  - (iii) to provide for the co-ordination of banking policy under the direction of the Reserve Bank;
  - (iv) to control the volume of credit in circulation and bank interest rates; and
  - (v) to provide machinery for the control of foreign exchange.
- (b) The *Reserve Bank Act 1959* which provides for the constitution and management of the Reserve Bank of Australia, the administration of the *Banking Act 1959* and the management of the Australian note issue.
- (c) The *Commonwealth Banks Act 1959* which provides for the constitution and management of the Commonwealth Banking Corporation, Commonwealth Bank of Australia, Commonwealth Savings Bank of Australia, and the Commonwealth Development Bank of Australia.

Notwithstanding the provisions of the above legislation, recent Australian governments have sought to decrease the degree of regulation imposed on the Financial Sector, and on banking activity in particular. Specifically, controls on most bank interest rates and foreign exchange have been relaxed. In addition, eighteen new private banks have been granted licences to commence operations.

Information on more specific aspects of the growth and control of the banking industry is contained in earlier issues of the *Year Book* (Nos. 31, 37, 45, 46 and 61).

As a result of the further development of the financial market and the increasing significance in the market of the non-bank financial institutions such as finance companies, building societies and money market dealers, the *Financial Corporations Act 1974* was introduced. The object of this Act is to assist the government to achieve effective management of the Australian economy by providing a means for the examination and regulation of the activities of non-bank financial institutions having regard to economic stability, the maintenance of full employment, the efficient allocation of productive resources, the ensuring of adequate levels of finance for housing and the economic prosperity and welfare of the people of Australia. Details of the operation and application of the Act are given in *Year Book* No. 62, page 541.

## Other Commonwealth legislation directly affecting financial institutions

### Insurance

Section 51 of the Commonwealth Constitution confers the necessary powers on the Commonwealth Parliament to legislate with respect to 'insurance, other than State insurance; also State insurance extending beyond the limits of the State concerned'. Commonwealth legislation includes the *Marine Insurance Act 1909* defining the limits of marine insurance and regulating the terms of contracts, etc.; the *Life Insurance Act 1945* generally regulating life insurance business in Australia; the *Insurance Act 1973* generally regulating general (non-life) insurance business in Australia and the *Insurance (Agents and Brokers) Act 1984*. The *Marine Insurance Act 1909* has limited application.

### *Life Insurance Act 1945*

The objects of this Act are:

- (a) to replace all State legislation on the subject of life insurance except that relating to the life insurance operations of State government insurance offices within the State concerned, and to provide uniform legislation for the whole of Australia;
- (b) to appoint a Life Insurance Commissioner to exercise active supervision of the activities of life insurance companies, with a view to securing the greatest possible protection for policy holders; and
- (c) to set up adequate machinery for dealing with any company that fails to maintain a required minimum standard of solvency.

The Act came into operation on 20 June 1946. The Life Insurance Commissioner issues an annual report which contains detailed information on the operations of life insurance companies.

*Insurance Act 1973*

The objects of this Act are:

- (a) to appoint an Insurance Commissioner to exercise active supervision of the financial activities of companies conducting general (non-life) insurance business, apart from State government insurance whether or not extending beyond the limits of the State concerned and other organisations specified in the Act, with a view to securing the greatest possible protection for policy holders; and
- (b) to set up adequate machinery for dealing with any company that fails to maintain a required minimum standard of solvency.

The Act came into operation on 19 June 1973. The Insurance Commissioner issues an annual report which contains detailed information on the operations of insurance companies.

*Insurance (Agents and Brokers) Act 1984*

The prime objective of the Act is to regulate the activities of insurance agents and brokers with a view to strengthening the financial stability of the industry overall. The Act received Royal Assent on 25 June 1984 although most of its regulatory provisions did not become operative until 1 January 1986.

**State legislation**

In each State there exists legislation designed to regulate the activities and monitor the solvency position of particular types of financial institutions which operate on a co-operative basis and lend predominantly to members or consumers. In general, they form the groups covered later in this chapter under the headings of Permanent Building Societies, Co-operative Housing Societies and Credit Unions.

In some States there is also legislation for the incorporation of State government bodies which operate as banks or insurance offices. Though the regulations in Commonwealth legislation do not directly apply to these bodies, details of their operations have been included in the relevant parts of this chapter because they have agreed to supply information consistent with regulatory reports on a voluntary basis.

**BANKS****Reserve Bank of Australia**

The Reserve Bank of Australia preserved and continued in existence the original corporate body known as the Commonwealth Bank of Australia under the new name Reserve Bank of Australia.

The general functions of the Reserve Bank are set out in Section 10 of the *Reserve Bank Act 1959*, which states:

'It is the duty of the Board, within the limits of its powers, to ensure that the monetary and banking policy of the Bank is directed to the greatest advantage of the people of Australia and that the powers of the Bank under this Act, the *Banking Act 1959*, and regulations under that Act are exercised in such a manner as, in the opinion of the Board, will best contribute to:

- (a) the stability of the currency of Australia;
- (b) the maintenance of full employment in Australia; and
- (c) the economic prosperity and welfare of the people of Australia.'

**Management**

The policy of the Reserve Bank is determined by a Board consisting of the Governor (Chairman), the Deputy Governor, the Secretary to the Treasury, and seven other members appointed by the Governor-General. The Bank is managed by the Governor, who acts in accordance with the policy of the Board and with any directions of the Board. The Bank is required to inform the government of the monetary and banking policy of the Board. In the event of a disagreement between the government and the Board as to whether the monetary and banking policy of the Bank is directed to the greatest advantage of the people of Australia, the Governor-General, acting with the advice of the Executive Council, may determine the policy to be adopted by the Bank.

## Central Banking business

Under the *Commonwealth Bank Act 1911* and the war-time powers conferred by the National Security Regulations, the Commonwealth Bank gradually assumed the functions of a Central Bank. Part III of the *Commonwealth Bank Act 1945* formally constituted the bank as a Central Bank and granted the necessary powers to carry on the business of a Central Bank, these powers being carried through into the present Act constituting the Reserve Bank.

## Note Issue Department

The Note Issue Department, established in 1920 when the control of the Australian note issue was transferred from the Commonwealth Treasury to the Commonwealth Bank, was maintained in the same form under the *Reserve Bank Act 1959*. The Reserve Bank may, through this Department, issue, re-issue and cancel Australian notes.

## Rural Credits Department

The Rural Credits Department, established in 1925 for the purpose of making short-term credit available for the orderly marketing of primary produce, was continued in the same form under the *Reserve Bank Act 1959*. The Reserve Bank may, through this Department, make advances upon the security of primary produce placed under the legal control of the Bank, or other security associated with the production or marketing of primary produce, to co-operative associations or marketing boards formed under the laws of the Commonwealth or a State or Territory of the Commonwealth or other bodies specified by proclamation. The period of the advance is not to exceed one year.

(a) Includes currency at short call and International Monetary Fund drawing rights. (b) Includes Treasury bills and Treasury notes. (c) At cost, less amounts written off.

## Trading banks

Commercial banking in Australia is conducted by twenty-eight trading banks. Three large private trading banks, together with the Commonwealth Bank of Australia, are generally referred to as the major trading banks. These banks provide widespread banking facilities

throughout Australia. The remaining twenty-four banks comprise four overseas banks, three State-owned banks and seventeen private banks.

The major trading banks are: Commonwealth Bank of Australia; Australia and New Zealand Banking Group; Westpac Banking Corporation; and the National Australia Bank Limited.

### Liabilities and assets

Balance sheet information contained in the following table does not relate to uniform accounting periods but rather to the balance dates of banks within the years shown.

#### AUSTRALIAN TRADING BANKS(a): LIABILITIES AND ASSETS(b)

(\$ million)

##### LIABILITIES

|                | Paid-up capital | Reserve funds (used in business of banks) (c) | Final dividend proposed | Balance of profit and loss account | Total share-holders' funds | Balances due to other banks | Deposits, bills payable and other liabilities | Total   |
|----------------|-----------------|-----------------------------------------------|-------------------------|------------------------------------|----------------------------|-----------------------------|-----------------------------------------------|---------|
| 1981 . . . . . | 770             | 1,496                                         | 90                      | 304                                | 2,660                      | 4,208                       | 41,735                                        | 48,603  |

## Savings banks

Savings bank business in Australia is conducted by seventeen banks. These comprise subsidiaries of the four major trading banks, three State-owned banks, seven private banks, two trustee banks and one overseas bank.

All savings banks, including trustee savings banks but not State savings banks, are subject to the *Banking Act 1959*.

## Liabilities and assets

Balance sheet information contained in the following table does not relate to uniform accounting periods but rather to the balance dates of banks falling within the years shown.

(a) Excludes the State banks. (b) Relates to liabilities and assets both inside and outside Australia. (c) Includes deposits with and loans to specified lenders other than trading banks.

### Branches and agencies

At 30 June 1987 the savings banks operated 6,021 branches and 8,632 agencies of which 3,345 branches and 3,910 agencies were in metropolitan areas.

More detailed statistics relating to trading banks may be found in the monthly publication *Savings Banks, Australia* (5602.0), and the quarterly publication *Banking, Australia* (5605.0).

## Development banks

### Commonwealth Development Bank of Australia

The Commonwealth Development Bank of Australia was established by the *Commonwealth Banks Act 1959* and commenced operations on 14 January 1960. It was formed basically from an amalgamation of the Mortgage Bank and Industrial Finance Departments of the former Commonwealth Bank of Australia. The functions of the Development Bank are to provide finance for the purpose of primary production (which includes fishing, forestry and all forms of rural activity) and for the establishment or development of small business undertakings (i.e. with shareholders'/proprietors' funds not exceeding \$5 million) in cases where such finance is not otherwise available on reasonable and suitable terms and conditions.

Two types of facility are provided—loans over medium to long terms and equipment finance over short terms. Loans to primary industry may be for all types of farm development, property purchase and restructuring of private mortgage debt. Loans to small businesses may be for establishment of new enterprises or for development of existing businesses in all sectors including manufacturing, retail and wholesale trade, transport, tourism, professions, entertainment and service industries. Equipment finance is provided for the acquisition of plant and vehicles for both primary industry and business undertakings. The Bank has widened its policy to lend for working capital and to re-finance loans from non-bank sources.

The Commonwealth Development Bank is managed by a General Manager under the Managing Director of the Commonwealth Banking Corporation and its policy is determined by the Board of that Corporation.

### Australian Resources Development Bank Limited

The Australian Resources Development Bank Limited was established in 1967 with equity capital of \$3 million subscribed by the major trading banks. It was given the status of a bank under the *Banking Act 1959* and opened for business on 29 March 1968. The main object of the Australian Resources Development Bank is to assist Australian enterprises to participate more fully in the development of Australia's natural resources. It provides finance to enterprises engaged in major developmental projects by direct loans, investing in equity capital or by refinancing loans made by trading banks acting individually or as a group. The Australian Resources Development Bank obtains funds by accepting deposits and by borrowing on the Australian and overseas capital markets.

## The Primary Industry Bank of Australia Limited

The Primary Industry Bank of Australia Limited commenced operations on 22 September 1978 under the authority of the *Primary Industry Bank Act 1977*. The Bank has also been brought within the scope of the *Banking Act 1959* including those provisions relating to the protection of depositors, advances policy, control of interest rates, furnishing of statistics, and alterations in the structure and ownership of the Bank.

The main objective of the Bank is to facilitate the provision of loans to primary producers for longer terms than are otherwise generally available. The Bank's role is restricted to refinancing loans made by banks and other financial institutions with terms of eight years or more but not exceeding thirty years.

The equity capital of the Bank is \$5.6 million consisting of six shares. Five shares are held by the Commonwealth Government and the major trading banks, while the sixth share is held equally by the four State banks.

## REGISTERED BUILDING SOCIETIES

### Permanent building societies

A permanent building society is defined as an organisation that:

- is registered under relevant State or Territory legislation;
- has not by its rules any fixed date or certain event or result when it is to terminate;
- is authorised to accept money on deposit;
- operates on a co-operative basis by borrowing predominantly from its members and providing finance to its members principally in the form of housing loans.

In 1976 a statistical collection was introduced covering the financial accounts of permanent building societies in all States and Territories of Australia. The statistics below summarise information collected from the 68 permanent building societies balancing in the 1985-86 financial year. More detailed descriptions and dissections of these statistics may be found in the annual publication *Permanent Building Societies: Assets, Liabilities, Income and Expenditure, Australia* (5632.0).

Information relating to the housing finance operations of permanent building societies is provided on page 832 and in the monthly publication *Housing Finance for Owner Occupation, Australia* (5609.0).

Summary statistics on the assets and selected liabilities of permanent building societies registered under the *Financial Corporation Act 1974* are given on pages 825 and 826.

(a) Represents payments made by societies to separate management companies. (b) Includes Permanent Building Society Association costs, advertising, bank charges and other administrative expenses.

### Co-operative housing societies

A co-operative housing society is defined as an organisation that:

- is registered under the relevant State or Territory legislation;
- is not authorised to accept money on deposit;
- is only allowed to raise money on loans;
- only provides finance to its members in the form of housing loans;
- does not cause or permit applicants for loans to ballot for precedence or in any way make the granting of a loan dependent on any chance or lot.

The statistics below summarise information collected from the 2,332 co-operative housing societies balancing within the 1985-86 financial year. More detailed descriptions and dissections of these statistics may be found in the annual publication *Co-operative Housing Societies: Assets, Liabilities, Income and Expenditure, Australia* (5633.0).

## CREDIT CO-OPERATIVES

A credit co-operative (or credit union) is defined as an organisation that:

- is registered under relevant State or Territory legislation;
- operates on a co-operative basis by predominantly borrowing from and providing finance to its own members.

Credit co-operative annual financial account statistics were first collected on a national basis from all registered credit co-operatives for the year 1974-75 when there were 738 credit co-operatives with a total of 909,547 members. The number of credit co-operatives operating in 1985-86 was 454 with 2,311,228 members. Comprehensive financial account statistics are provided in the annual publication *Credit Co-operatives: Assets, Liabilities, Income and Expenditure, Australia* (5618.0).

Statistics on the assets and selected liabilities of credit co-operatives registered under the *Financial Corporations Act 1974* which have assets in Australia exceeding \$5 million are provided on pages 825 and 826.

(a) Includes financial institutions duty. (b) Includes bank accounts debit tax.

## SHORT-TERM MONEY MARKET

### Authorised money market corporations

For some years prior to 1959, leading stockbrokers were actively engaged in operations which formed the basis of a short-term money market in Australia. The stockbrokers' operations involved the acceptance of short-term funds which were secured against govern-

ment securities. These operations were severely limited by the lack of suitable short-term securities and by liquidity constraints. In February 1959 the Central Bank established the Official Short-Term Money Market by making available 'lender of last resort' facilities to selected dealers.

There are nine authorised money market dealers. Under the 'lender of last resort' arrangements, dealers may borrow from the Reserve Bank for a minimum of seven days and at a rate designed to discourage excessive recourse to the facility.

They are required by the Reserve Bank to:

- accept loans overnight, at call or for fixed periods, in minimum amounts of \$50,000 and invest these funds in Commonwealth Government and other approved securities;
- at all times be willing traders in the buying and selling of approved securities;
- have a minimum paid-up capital of \$400,000 and adhere to a maximum limit on the ratio of loans to shareholders' funds;
- consult regularly with the Reserve Bank on all money market matters and furnish detailed information about their portfolios, operations, interest rates, balance sheets and profit and loss accounts.

The following table contains details of selected liabilities and assets, and interest rates. Additional information on authorised dealers collected under the *Financial Corporations Act 1974* is provided on pages 825 and 826.

(a) Within 5 years of maturity. (b) Accepted or endorsed by banks. (c) Weighted average of rates paid on all days of the four or five weeks ending on the last Wednesday of the month.

#### Money market corporations

There are also companies without Reserve Bank 'lender of last resort' facilities which operate in a similar manner to authorised dealers. These companies are recognised under the *Financial Corporations Act 1974* in the category of money market corporations. This category consists of registered corporations whose short-term borrowings are a substantial proportion of their total outstanding provision of finance, which is mainly in the form of loans to authorised dealers in the short-term money market and other liquidity placements, business loans and investments in government, commercial and corporate paper.

The category of money market corporations also includes registered corporations providing short-term finance but which are themselves financed by related corporations with funds raised on a short-term basis, as well as corporations which borrow principally short-term and lend predominantly to related money market corporations.

Statistics on money market corporations registered under the *Financial Corporations Act 1974* are contained in the tables on pages 825 and 826.

## FINANCE COMPANIES

Information presented on finance companies in Australia in the following tables has been compiled from returns collected under the *Census and Statistics Act 1905*. For the purpose of these statistics, a finance company is defined as an incorporated company or a group of incorporated companies related under Section 7 of the *Companies Act 1981*, mainly engaged in providing to the general public (businesses as well as persons in their private capacity) any of the following types of credit facilities:

- instalment credit for retail sales;
- personal loans;
- wholesale finance;
- factoring;
- other consumer and commercial loans;
- finance leasing of business plant;
- equipment and bills of exchange transactions.

A company is mainly engaged in providing these types of credit facilities if 50 per cent or more of its assets consist of balances outstanding with respect to such facilities, or if 50 per cent or more of its income is derived from such facilities.

The statistics for the financial year relate to those finance companies which have balances outstanding net of unmatured income in the prescribed types of credit facilities of \$5 million or more in total on an Australia-wide basis. The 1983-84 annual census of finance companies indicated that companies thus included accounted for 99.1 per cent of the total net balances outstanding on prescribed credit facilities of all finance companies.

More detailed descriptions and dissections of these statistics may be found in the annual publication *Finance Companies: Assets, Liabilities, Income and Expenditure, Australia* (5616.0).

Due to differences in coverage and classification criteria and definitions of data items, the statistics for finance companies shown below are not comparable with the statistics, compiled from returns submitted under the *Financial Corporations Act 1974*, for finance companies and general financiers contained in the tables on pages 825 and 826.

## FINANCIAL CORPORATIONS STATISTICS

The statistics provided in the following tables have been compiled from returns supplied to the Australian Bureau of Statistics by corporations registered under the *Financial Corporations Act 1974* (FCA). A summary of the objects and content of the Financial Corporations Act is given in *Year Book* No. 62, page 541.

More detailed descriptions and dissections of these statistics may be found in the monthly publications *Building Societies, Australia* (5637.0); *Authorised Dealers and Money Market Corporations, Australia* (5638.0); *Finance Companies, Australia* (5639.0) and *Credit Co-operatives, General Financiers and Other Financial Corporations, Australia* (5640.0).

Descriptions of the categories *building societies, credit unions/co-operatives, authorised money market dealers and money market corporations* appear in the respective parts of this chapter. Descriptions of the other categories are as follows:

**Pastoral finance companies**—comprising corporations whose provision of finance is predominantly in the form of loans to rural producers largely associated with the provision of rural services.

**Finance companies**—comprising corporations which rely substantially on borrowings in financial markets in Australia and/or from abroad and whose provision of finance is predominantly in the form of business and commercial lending, instalment credit to finance retail sales by others and/or other loans to individuals.

**General financiers**—comprising corporations which lend predominantly for business and commercial purposes, instalment credit to finance retail sales by others and/or other loans to individuals but which do not rely substantially on borrowings in financial markets in Australia and from abroad.

**Intra group financiers**—comprising corporations which predominantly borrow within a corporation group and/or provide finance by lending within their corporation group or by investing in financial markets.

**Other financial corporations**—comprising registered corporations not included in any other specific category.

(a) Excludes credit co-operatives and general financiers with assets not exceeding \$5 million. (b) Excludes transactions with related corporations in the same FCA category. (c) Excludes bills that have been drawn or accepted by reporting corporations. (d) Includes holdings of bills that have been drawn by reporting corporations and loans that have been re-financed by the sale of bills accepted by reporting corporations.

## CASH MANAGEMENT TRUSTS

A monthly statistical collection was introduced in May 1983 to obtain information on the operations of cash management trusts. A cash management trust is a unit trust which is governed by a trust deed, is open to the public, generally confines its investments to financial securities available through the short term money market, and whose units are redeemable by the trustee to the unit holder on demand.

The following table summarises the financial operations of cash management trusts.

## CASH MANAGEMENT TRUSTS

| June—          | Number of Trusts | Units in issue at end of period (\$million) | Weighted average net yield at end of period (% per annum) | Assets (\$ million)          |                              |                                      |                                     |              | Total assets |
|----------------|------------------|---------------------------------------------|-----------------------------------------------------------|------------------------------|------------------------------|--------------------------------------|-------------------------------------|--------------|--------------|

## PUBLIC UNIT TRUSTS

A quarterly statistical collection was introduced in September 1985 to obtain information on the operations of listed and unlisted public unit trusts.

A public unit trust is defined as an arrangement (fund) which is governed by a trust deed between a management company and a trustee company; is open to the public within Australia for the purpose of investing the pooled funds of unitholders to yield returns in the

form of income and/or capital gains; and allows unitholders to dispose of their units within a relatively short period of time. These statistics exclude cash management trusts, private trusts and trusts exempted from providing redemption facilities (e.g. film and agricultural trusts).

The major distinction between a listed and an unlisted unit trust is that a listed unit trust's units must be listed on Australian Stock Exchanges and adhere to listing requirements similar to those for company shares.

The following tables summarise the financial operations of public unit trusts.

#### UNIT TRUSTS: SUMMARY

| <i>Assets (\$ million)</i> |                         |                                                         |               |                                           |                                                                     |                     |                     |
|----------------------------|-------------------------|---------------------------------------------------------|---------------|-------------------------------------------|---------------------------------------------------------------------|---------------------|---------------------|
| <i>Quarter</i>             | <i>Number of Trusts</i> | <i>Units in issue at end of the period (\$ million)</i> | <i>Shares</i> | <i>Property at the end of the quarter</i> | <i>Loan outstandings secured by mortgages on land and buildings</i> | <i>Other assets</i> | <i>Total assets</i> |
| <b>UNLISTED</b>            |                         |                                                         |               |                                           |                                                                     |                     |                     |
| 1984-85—                   |                         |                                                         |               |                                           |                                                                     |                     |                     |

#### LIFE INSURANCE

Statistics in the following tables have been derived from the publications of the Life Insurance Commissioner and relate to the life insurance business of companies with head offices in Australia and the Australian business of companies with head offices overseas. Also included are the life business operations voluntarily reported by three State Government Insurance Offices.

Forty-eight life offices conducted life insurance business in Australia during 1985. Information contained in the following three tables does not relate to uniform accounting periods but to the balance dates of organisations falling within the calendar year shown.

(a) Includes transfers.

## GENERAL INSURANCE

Statistics in the following tables have been derived from the publications of the Insurance and Superannuation Commissioner and returns collected under the *Census and Statistics Act 1905*. They measure the direct insurance of Australian risks. The statistics relate to the operations of:

- (a) *Bodies corporate* authorised to carry on insurance business under the *Insurance Act 1973*;
- (b) *Brokers* in respect of business placed with overseas insurers; and
- (c) *Government instrumentalities*, i.e. State Government Insurance Offices and Commonwealth Government and State Government instrumentalities in respect of their general insurance business.

These statistics are based on the following definitions:

**Premiums** comprise the full amount receivable in respect of direct insurance and facultative reinsurance business written or renewed within Australia (including business placed overseas by Australian brokers) during the year less (a) outward facultative reinsurance within Australia, (b) stamp duty and fire service charges paid, and (c) returns, rebates and bonuses paid or credited to policy holders. Premiums are not adjusted to provide for premiums unearned at the end of the year and consequently the amounts differ from 'earned premium income' appropriate to the year.

**Claims** comprise, for direct insurance and facultative reinsurance business, payments made during the year plus the estimated amount of outstanding claims at the end of the year less the estimated amount of outstanding claims at the beginning of the year. Salvage and other amounts recoverable have been deducted.

In many instances brokers have no knowledge of claims made by the insured on overseas insurers in respect of business placed through them. Because of this, no details of claims are collected from brokers.

Information contained in the following tables does not relate to uniform accounting periods but to the financial years of the organisations which ended during the years shown.

**GENERAL INSURANCE: PREMIUMS AND CLAIMS BY  
PRINCIPAL CLASS OF BUSINESS**

(\$ million)

| All other                              | 254.6          | 258.4          | 313.1          |
| <b>Total</b>                           | <b>5,911.0</b> | <b>6,982.7</b> | <b>8,937.3</b> |

(a) Includes premiums received by brokers 1981-82, \$94.7 million; 1982-83, \$145.1 million; 1983-84, \$193.3 million. (b) Includes sprinkler leakage, loss of profits, and crop and hailstone insurance. (c) Excludes workers' compensation insurance in the coal mining industry in N.S.W. (d) Includes product liability and professional indemnity insurance. (e) Excludes brokers.

## SUPERANNUATION FUNDS AND SCHEMES

The following statistics have been compiled from several superannuation surveys conducted by the Australian Bureau of Statistics for the year 1984-85. Detailed definitions of data items are provided in ABS publications *Superannuation Funds, Australia 1984-85* (5649.0) and *Public Authority Pension and Superannuation Schemes, Australia* (5511.0).

The following types of superannuation schemes and funds, whose primary purpose is to provide benefits on retirement, are covered:

Private sector funds—

    Restricted membership funds—

        Employees' funds

        Self-employed persons' one member funds

        Self-employed persons' group funds

    Open funds

Public sector funds and schemes—

    Self-administered funds

    Life insurance offices' funds and schemes

Excluded from these statistics are:

- private sector funds that are wholly administered by life insurance offices;
- superannuation arrangements in the private sector that are unfunded (i.e. where the benefits are met from the employers' resources as they are payable);
- public sector schemes funded from Consolidated Revenue.

(a) Includes co-operative housing societies, finance companies, governments, credit co-operatives and insurance companies.

## PERSONAL, COMMERCIAL AND LEASE FINANCE

Three new monthly collections were introduced in January 1985 to measure the lending activity of significant lenders in the fields of personal, commercial and lease finance. These collections replaced two previous collections, the results of which were published in *Finance Companies, Australia* (5614.0) and *Instalment Credit for Retail Sales, Australia* (5631.0).

### Personal finance

The following tables present statistics of finance commitments made by significant lenders to individuals for their own personal (non-business) use. For more comprehensive statistics and detailed information on the scope and coverage of these statistics refer to the monthly publication *Personal Finance, Australia* (5642.0).

#### PERSONAL FINANCE COMMITMENTS(a): TYPE OF LENDER

(\$ million)

|                   | All banks | Finance companies | Credit Co-operatives | Other lenders(b) | Total    |
|-------------------|-----------|-------------------|----------------------|------------------|----------|
| 1985-86 . . . . . | 9,764.0   | 3,252.0           | 1,659.0              | 229.9            | 14,905.1 |
| 1986-87 . . . . . | 10,166.3  | 2,926.9           | 1,771.0              | 365.7            | 15,229.9 |

(a) Includes both fixed loan facilities and new and increased lending commitments under revolving credit facilities. (b) Includes permanent building societies, general financiers, retailers, and for 1985-86 only, life insurance companies.

#### PERSONAL FINANCE COMMITMENTS: TYPE OF FACILITY, ALL LENDERS

(\$ million)

|                      | Fixed loan commitments | New and increased credit limits | Revolving credit commitments                  |               | Used    |
|----------------------|------------------------|---------------------------------|-----------------------------------------------|---------------|---------|
|                      |                        |                                 | Cancellations and reductions in credit limits | Credit limits |         |
|                      |                        |                                 |                                               | Total         |         |
| 1985-86(a) . . . . . | 10,635.1               | 4,270.1                         | 2,316.3                                       | 13,084.2      | 5 501.1 |
| 1986-87 . . . . .    | 9 754.4                | 5 475.4                         | 2 558.4                                       | 16 993.4      | 7 665.1 |

(a) Includes commitments for loans on life policies.

### Commercial finance

The statistics in the following tables measure commercial finance commitments made by significant lenders to government, private and public enterprises and non-profit organisations as well as to individuals (for investment and business purposes). For more comprehensive statistics and detailed information on the scope and coverage of these statistics refer to the monthly publication *Commercial Finance Australia* (5643.0).

#### COMMERCIAL FINANCE COMMITMENTS(a): TYPE OF LENDER

(\$ million)

|                   | Trading banks | Other banks | Finance companies | Money market corporations | Other lenders(b) | Total    |
|-------------------|---------------|-------------|-------------------|---------------------------|------------------|----------|
| 1985-86 . . . . . | 38,426.9      | 2,387.1     | 7,986.1           | 11,670.7                  | 845.7            | 61,316.5 |
| 1986-87 . . . . . | 57,647.0      | 3,189.9     | 6,949.6           | 9,132.4                   | 203.2            | 77,122.0 |

(a) Includes both fixed loan facilities and new and increased lending commitments under revolving credit facilities. (b) Includes permanent building societies, general financiers and pastoral finance companies.

## COMMERCIAL FINANCE COMMITMENTS: FIXED LOAN FACILITIES

(\$ million)

|                   | Construction | Purchase of real property | Purchase of plant and equipment | Refinancing | Other purposes | Total    |
|-------------------|--------------|---------------------------|---------------------------------|-------------|----------------|----------|
| 1985-86 . . . . . | 3,535.9      | 4,622.9                   | 2,197.0                         | 2,653.7     | 12,391.8       | 25,401.2 |
| 1986-87 . . . . . | 3,455.9      | 4,484.1                   | 2,031.9                         | 2,579.5     | 10,831.9       | 23,383.2 |

## COMMERCIAL FINANCE COMMITMENTS (a) INDUSTRY OF BORROWER

(\$ million)

| Industry of borrower                               | 1985-86                                  |                                               |                                     | 1986-87                                  |                                               |                                     |
|----------------------------------------------------|------------------------------------------|-----------------------------------------------|-------------------------------------|------------------------------------------|-----------------------------------------------|-------------------------------------|
|                                                    | New fixed loan commitments during period | New and increased credit limits during period | Total new commitments during period | New fixed loan commitments during period | New and increased credit limits during period | Total new commitments during period |
| Agriculture, forestry, fishing & hunting . . . . . | 2,186.2                                  | 2,487.4                                       | 4,673.6                             | 1,712.0                                  | 3,197.5                                       | 4,909.5                             |
| Mining . . . . .                                   | 656.7                                    | 1,350.7                                       | 2,007.4                             | 537.4                                    | 2,745.9                                       | 3,283.3                             |
| Manufacturing . . . . .                            | 2,255.8                                  | 6,289.6                                       | 8,545.4                             | 1,928.1                                  | 10,196.3                                      | 12,124.4                            |

(a) Includes share subscriptions by overseas investors to issues in Australia. (b) Period from date of issue to maturity. Securities that are repayable at call or on an indefinite date are included in the "12 months or less" period. (c) Includes bonus issues, conversion issues, issues in exchange for existing shares, etc. (d) Includes calls on issues commenced in earlier years. (e) Includes conversions, renewals, etc.

These statistics cover capital raised through share and debenture subscriptions and by way of deposits, unsecured notes and loans secured over the entire assets of the company. The following funds are excluded from the collection:

- all capital raised from Australian banks (other than direct equity investment), i.e. overdrafts, mortgage loans, terms loans or debentures;
- temporary advances or short-term deposits from any source;
- complete or partial issues by Australian companies on overseas markets taken up through overseas brokers.

Listed companies are companies incorporated in Australia whose shares, debentures or other securities are listed on one or more of the Australian Stock Exchanges. For such companies new capital includes:

- all issues of ordinary shares if any ordinary shares are listed;
- all issues of preference shares if any preference shares are listed;
- all issues of debentures, unsecured notes, secured and unsecured loans and deposits if any shares or other securities are listed.

More detailed statistics concerning New Capital Raisings may be found in the quarterly publication *New Capital Raisings by Companies Listed on Australian Stock Exchanges* (5628.0).

## CHAPTER TWENTY-FOUR

### PUBLIC FINANCE

---

This chapter deals with the financial activities of the organisations which make up the three levels of government in the Australian political system—Commonwealth, State and local—and which collectively constitute the public sector. An account is given of the activities of each level of government, with particular emphasis being given to the Commonwealth Government. Tables are then presented which bring together the transactions of all public non-financial enterprises to highlight the role in the Australian economy of the public sector as a whole. Then follows a section on government borrowing activities at all levels. A special article covering the development of Commonwealth–State financial arrangements is included at the end of the chapter.

#### Concepts and definitions used in public finance statistics

The tables below (except those explicitly sourced to Budget Papers) are provided from the system of government finance statistics (GFS). To assist users in understanding the statistics presented in these tables, a separate publication *Classifications Manual for Government Finance Statistics, Australia* (1217.0) has been produced. It outlines the major concepts used, provides definitions of the enterprise unit used for GFS collections and the categories in each of the main unit, and of transactions classifications employed. The GFS classifications used in the tables that follow are:

- the *Economic Transactions Framework* (ETF) which categorises outlays, revenue, grants received and financing transactions according to their economic character to facilitate study of the macroeconomic effect of government activity on the economy and to provide the basic building blocks for grouping transactions to be incorporated into the Australian National Accounts;
- the *Taxes, Fees and Fines Classification* (TFFC) which dissects this major form of government revenue according to the type of tax, fee or fine collected; and
- the *Government Purpose Classification* (GPC) which is used to group outlays with similar functions to facilitate study of the broad purposes of public sector spending and assessment of the effectiveness of outlays in meeting government policy objectives.

#### Commonwealth Government finance

##### Financial provisions of the Constitution

The main provisions of the Constitution relating to the initiation and development of the financial system of the Commonwealth of Australia are contained in Sections 81 to 105A of the Commonwealth Constitution.

Two other sections which have a most important bearing on questions of Commonwealth finance are Sections 69 and 51. Section 69 provides for the transfer from the States to the Commonwealth of certain specified departments, and Section 51, in outlining the powers of the Commonwealth Parliament, implies the transfer or creation of other departments.

Sections 87 and 96 of the Constitution deal with the financial relations between the Commonwealth and the States. The full text of the Financial Agreement of 1927 was given in *Year Book* No. 31, page 21; accounts of this Agreement as affected by subsequent Agreements were included in later issues of the *Year Book* up to No. 37; details of the main provisions appeared in further issues of the *Year Book* up to No. 50. For details of current provisions for financial assistance to the States reference should be made to the Commonwealth Budget Paper No. 7 *Payments to or for the States, the Northern Territory and Local Government Authorities, 1986–87*.

The *Audit Act 1901* lays down the procedure which must be followed in accounting for the receipt and disbursement of public funds. The general administration of Commonwealth Government finances is the responsibility of the Commonwealth Minister for Finance.

## Commonwealth Government Budget

The Commonwealth Government Budget records the transactions of those enterprises of the Commonwealth Government whose receipts and payments are summarised in the statements of Public Account balances. In 1985-86 the change in cash balances was represented by the following:

|                                                                                                           | \$'000      |
|-----------------------------------------------------------------------------------------------------------|-------------|
| Net Cash receipts of the Consolidated Revenue Fund . . . . .                                              | 65,513,488  |
| <i>plus</i> cash receipts of Loan Fund . . . . .                                                          | 37,498,087  |
| <i>plus</i> cash receipts of Trust Fund . . . . .                                                         | 6,310,132   |
| <i>Total</i> . . . . .                                                                                    | 109,321,707 |
| <i>less</i> cash payments from Consolidated Revenue Fund . . . . .                                        | 65,513,488  |
| <i>less</i> cash payments from Loan Fund . . . . .                                                        | 37,498,016  |
| <i>Less</i> cash payments from Trust Fund (including decrease in investments of the Trust Fund) . . . . . | 5,869,176   |
| <i>Total</i> . . . . .                                                                                    | 108,880,680 |
| <i>equals</i> increase in cash balances . . . . .                                                         | 441,027     |

Revenues from taxation and other sources are paid into the Consolidated Revenue Fund, from which the main expenditures are for defence, social services, payments to the States and general administration. The Trust Fund covers special transactions outside the ordinary operations of departmental expenditures, such as pension funds and moneys held for expenditure by the Commonwealth Government at some future time. The Loan Fund receives its funds from the sale of the Commonwealth Government securities, and the expenditures from the Fund are made in accordance with the purpose of issue of each loan. The main disbursements from the Loan Fund are to the States by way of distribution of the proceeds of loans raised by the Commonwealth Government on their behalf and by capital assistance grants, the remaining disbursements being mainly for Commonwealth Government purposes.

The estimated outlay, revenue and deficit of the Budget for 1986-87 are set out in the table which follows, together with figures for the years 1981-82 to 1985-86. The national accounting presentation of the Budget is shown in order to be consistent with other transactions figures given in this chapter.

It should be noted that some transactions undertaken by enterprises covered by the Budget are not reflected in the change in cash balances, usually because they are not cash transactions or because a receipt and a payment are offset against each other so that only a net amount is included in published totals. The national accounting presentation of the Budget includes these additional transactions.

(a) Expenditure on new fixed assets *plus* increase in stocks *less* sales of previously rented houses. (b) The Commonwealth Non-Budget sector consists of enterprises which operate outside the Public Account. This includes both general government enterprises which largely depend on budget funding (e.g. ABC) and public trading enterprises which are largely self-financing (e.g. Telecom).

### Financing of the Commonwealth Government deficit

The deficit shown in the last line of the preceding table represents the net excess of Budget outlay over revenue. In other words, the estimated deficit shown for 1986-87 represents the Commonwealth Government budget sector's 'financing requirements'. Most such transactions involve the issue, repurchase, redemption or acquisition of Commonwealth Government securities, but some involve or are represented by changes in other assets or liabilities of the Commonwealth Government.

Specifically the deficit is financed as follows:

Net sales of Commonwealth Government securities (new issues *less* redemptions *less* net purchases from Commonwealth Government balances in the Trust Fund);  
*less* net purchases of other investments from Commonwealth Government balances in the Trust Fund  
*plus* minor items of indebtedness (such as borrowing by Australian Capital Territory housing trust account)  
*less* net additions to cash balances, and funds provided for the International Monetary Fund and the Australian Wheat Board.

A table summarising the financial transactions of the Commonwealth Government budget sector for recent years is given on page 378, Table 1 in 1986-87 *Budget Paper No. 1*.

### Commonwealth non-budget enterprises

In addition to the group of Commonwealth Government enterprises whose transactions are covered by the Budget (i.e. itemised in the Consolidated Revenue Fund, the Loan Fund, or recorded in a Trust Fund), there are a number of organisations owned or controlled by the Commonwealth Government whose transactions do not, for the most part, pass through the

Public Account. This category includes public trading enterprises such as the Australian Postal Commission, Australian Telecommunications Commission, Overseas Telecommunications Commission, Qantas Airways Ltd, Australian National Airlines Commission, the Australian Shipping Commission, the Snowy Mountains Hydro-electric Authority, and public financial enterprises such as the Reserve Bank and the Commonwealth Banking Corporation. Public trading and financial enterprises, it should be noted, are bodies which aim at covering the bulk of their expenses by revenue either from sales of goods and services (trading enterprises), or by charges for services and net interest receipts (financial enterprises). As well as these enterprises, there are other government enterprises which record most of their transactions outside the Public Account but have only minor independent sources of revenue and are financed almost entirely from funds voted to them each year from the Consolidated Revenue Fund. In order that the national accounting presentation may indicate, as completely as possible, the direct effect of the Budget on demand, appropriations to this last group of enterprises are treated as final expenditure in the Budget. Enterprises in this category include the Australian Broadcasting Corporation, Australian National University, National Capital Development Commission, and the Australian Nuclear Science and Technology Organisation.

The transactions of Commonwealth Government bodies not covered by the Budget may be brought together and consolidated with the transactions recorded in the Budget to yield figures of the transactions of all Commonwealth public sector enterprises which are owned and/or controlled by the Commonwealth Government. The remaining tables in this section have been prepared on that basis.

Public financial enterprises have been omitted from the consolidated accounts presented here largely on the ground that combining the income and outlay and capital financing transactions of the Reserve Bank, the publicly owned trading and savings banks, government insurance offices and other public financial institutions with the equivalent transactions of public trading enterprises and general government enterprises seems to provide a less meaningful account of public sector activity. For example, omission of the borrowing and lending activities of the government banks and the Reserve Bank allows attention to be centred on the borrowing and lending activities of general government and public trading enterprises, which are quite different in nature and economic effect from the financing activities of the banking system.

### **Coverage—Northern Territory Government**

On 1 July 1978 the Northern Territory became self-governing with expenditure responsibilities and revenue raising powers broadly approximating those of a State. In public finance statistics the Northern Territory Government is grouped with State and local governments from 1978–79 onwards. This results in a discontinuity in time series for the financial transactions of Commonwealth Government enterprises because:

- In the period up to and including 1977–78 Commonwealth spending on State-type services in the Northern Territory is included under the various Commonwealth outlay categories such as final consumption expenditure and gross capital formation. Similarly, State-type taxation and income from the Northern Territory public trading enterprises is included in the respective Commonwealth revenue categories.
- From 1978–79 onwards, Commonwealth spending in respect of the Northern Territory consists to a large extent of grants and advances to Northern Territory general government enterprises while State-type taxation and income from the Northern Territory public trading enterprises are no longer part of Commonwealth revenue.
- Not all State-type functions were fully transferred to the Northern Territory Government from 1 July 1978. Responsibility for health services was transferred on 1 January 1979 and responsibility for education services was transferred from 1 July 1979. The Commonwealth retains responsibility for certain State-type matters such as uranium mining and Aboriginal affairs (other than provision of services to Aboriginal communities).

### **Summary of outlay, revenue and net public sector borrowing requirement**

The outlay and revenue, and net public sector borrowing requirement, of all non-financial enterprises of the Commonwealth Government for the six-year period ending 1985–86 are given in the following table.

**OUTLAYS, REVENUE AND DEFICIT OF COMMONWEALTH GOVERNMENT**  
(**\$ million**)

|                                                                   | 1980-81 | 1981-82 | 1982-83 | 1983-84 | 1984-85 | 1985-86p |

(a) Interest, land rent, royalties and dividends paid.

## Grants and advances to the States and the Northern Territory

Commonwealth Government financial assistance to the States and the Northern Territory takes two main forms: (i) grants for general and specific purposes, and (ii) assistance for developmental and other specific purposes in the form of repayable advances. Some information about these forms of financial assistance is given below, but for more complete information reference should be made to the Commonwealth Government Budget Paper No. 7 *Payments to or for the States, the Northern Territory and Local Government Authorities*. Further information also appears in chapters of this *Year Book* dealing with the specific function which the payments are designed to serve.

### Grants to the States and the Northern Territory

The following tables show details of grants to the States and the Northern Territory classified by purpose.

**GRANTS TO STATES AND NORTHERN TERRITORY BY GOVERNMENT PURPOSE  
CLASSIFICATION AND STATE, 1985-86**

(\$ million)

|                                                                                     | N.S.W.  | Vic.    | Qld     | S.A.    | W.A.    | Tas.  | N.T.  | Total    |

**Advances to the States and the Northern Territory**

The Commonwealth is also providing financial assistance for State projects by way of repayable advances. Borrowings of the Loan Council which are advanced to the States for their work programs and advances for State housing projects represent the largest proportion of the total funds advanced. Full descriptions of the various programs for which funds have been advanced in recent years are given in *Payments to or for the States, the Northern Territory and Local Government Authorities*.

The following table shows figures of net advances to the States and Northern Territory by purpose.

**NET ADVANCES TO STATES AND THE NORTHERN TERRITORY BY GOVERNMENT  
PURPOSE CLASSIFICATION, 1985-86**

| Natural disaster relief . . . . .                       | -7.5          | -3.8        | 1.3        | -5.0        | -6.5        | -0.4        | —           | -21.9        |

Minus sign (-) denotes excess of repayments.

## Main sources of finance

The main sources of Commonwealth Government finance are taxation, income of public trading and financial enterprises, other factor income transfers, borrowing, and other financing transactions. Taxation constitutes by far the major source of revenue. In recent years, however, borrowing has become an increasingly significant source of funds.

In what follows, an account is given of the system of Commonwealth Government taxation, and some details are given of the current operations of Commonwealth public enterprises. Borrowings and other financing activities of Commonwealth enterprises are dealt with for convenience in a later section relating to the debt of all public sector enterprises.

### Commonwealth Government taxation—summary

The following table shows Commonwealth Government taxation revenue classified by type of tax for the six years ending 1985–86.

COMMONWEALTH GOVERNMENT—TAXES, FEES AND FINES BY TYPE  
(\$ million)

| Type of tax                                                   | 1980–81  | 1981–82  | 1982–83  | 1983–84  | 1984–85  | 1985–86  |
|---------------------------------------------------------------|----------|----------|----------|----------|----------|----------|
| Taxes, fees and fines . . . . .                               | 32,683.0 | 37,941.0 | 41,010.9 | 44,753.0 | 52,890.5 | 58,690.5 |
| Taxes on income . . . . .                                     | 22,373.1 | 26,462.7 | 28,045.3 | 29,618.0 | 35,300.7 | 39,352.4 |
| Income taxes levied on individuals . . . . .                  | 17,532.4 | 21,205.0 | 22,942.6 | 24,691.5 | 29,288.6 | 32,713.8 |
| Personal income tax . . . . .                                 | 17,532.1 | 21,204.5 | 22,941.6 | 24,690.5 | 29,287.4 | 32,712.5 |
| Mining withholding tax . . . . .                              | 0.3      | 0.5      | 1.0      | 0.9      | 1.2      | 1.2      |
| Income taxes levied on enterprises . . . . .                  | 4,564.0  | 4,903.1  | 4,688.8  | 4,460.3  | 5,414.3  | 5,928.0  |
| Company income tax (a) . . . . .                              | 4,552.8  | 4,883.3  | 4,663.6  | 4,439.2  | 5,400.2  | 5,906.1  |
| Income tax paid by superannuation funds . . . . .             | 11.1     | 19.8     | 25.2     | 21.2     | 14.2     | 22.0     |
| Income taxes levied on non-residents . . . . .                | 276.7    | 354.6    | 414.0    | 466.2    | 597.7    | 710.6    |
| Dividend withholding tax . . . . .                            | 114.1    | 125.6    | 133.8    | 129.6    | 154.8    | 209.3    |
| Interest withholding tax . . . . .                            | 46.6     | 79.0     | 124.1    | 174.7    | 247.9    | 351.3    |
| Other income tax levied on non-residents . . . . .            | 116.0    | 150.0    | 156.0    | 162.0    | 195.0    | 150.0    |
| Employers' payroll taxes . . . . .                            | 36.5     | 37.6     | 38.8     | 43.1     | 55.8     | 60.6     |
| General taxes (payroll tax) . . . . .                         | 17.0     | 19.3     | 21.4     | 23.8     | 28.8     | 33.9     |
| Selective taxes (stevedoring industry charges) . . . . .      | 19.5     | 18.2     | 17.5     | 19.3     | 26.9     | 26.8     |
| Taxes on property . . . . .                                   | 43.4     | 33.9     | 67.6     | 227.9    | 239.6    | 267.7    |

| Fees from regulatory services . . . . .                       | 58.8     | 72.8     | 78.4     | 83.9     | 123.6    | 150.3    |
| Fines . . . . .                                               | 4.2      | 7.8      | 7.9      | 9.6      | 7.9      | 7.4      |
| Taxes paid by public trading enterprises . . . . .            | 25.9     | 19.4     | 29.1     | 27.0     | 26.1     | 48.2     |

(a) Excludes income taxes paid by public trading enterprises.

## Taxes on income

A description of the development of income taxes in Australia appeared in *Year Book* No. 35, page 926. With the advent of Uniform Taxation in 1942, the States withdrew from the income tax field. While the Commonwealth remains the sole government imposing taxes on income, tax sharing arrangements have been made under which State and local government bodies receive a share of Commonwealth revenue.

The laws dealing with the assessment, declaration and imposition of income tax at 30 June 1987 were:

- *Income Tax Assessment Act 1936* (later referred to as 'the Assessment Act')
- *Income Tax Rates Act 1986* (as amended by the *Income Tax Rates Amendment Act 1987*)
- *Income Tax Act 1986*
- *Income Tax (Dividends and Interest Withholding Tax) Act 1974*
- *Income Tax (Drought Bonds) Act 1969*
- *Income Tax (Withholding Tax Recoupment) Act 1971*
- *Income Tax (Bearer Debentures) Act 1971*
- *Income Tax (Film Royalties) Act 1977*
- *Income Tax (Non-Resident Companies) Act 1978*
- *Income Tax (Mining Withholding Tax) Act 1979*
- *Income Tax (Diverted Income) Act 1981*
- *Income Tax (Securities and Agreements) (Withholding Tax Recoupment) Act 1986*

Both individuals and companies are liable for income tax. Private companies were subject to tax on certain undistributed income in addition to the primary income tax levied on all companies. Subject to phasing-out arrangements, however, this additional tax generally does not apply in relation to profits of the 1986-87 and latter income years.

The operation of the Assessment Act is affected by other Acts, the more important of which are:

- (a) *Taxation Administration Act 1953*, which provides for the administration of certain Acts relating to taxation and the screening for taxation purposes of applications for exchange control approval.
- (b) *Income Tax (International Agreements) Act 1953*, which gives the force of law to agreements with other countries for the avoidance of double taxation. Australia has concluded comprehensive agreements for the avoidance of double taxation with the United Kingdom, the United States of America, Canada, New Zealand, Singapore, Japan, the Federal Republic of Germany, the Netherlands, France, Belgium, the Philippines, Switzerland, Malaysia, Sweden, Denmark, Ireland, Norway, the Republic of Korea, Malta, Italy and Finland. In addition, as at 30 June 1985, a comprehensive agreement with Austria had been signed but had not entered into force. Limited agreements dealing with airline profits have been concluded with France, Italy, Greece and India.
- (c) Taxation (Unpaid Company Tax) Assessment Act and related legislation.
- (d) *The States (Tax Sharing and Health Grants) Act 1981*, which provides for the States and Northern Territory to receive a proportion of total Commonwealth tax collections.
- (e) *Income Tax (Arrangements with the States) Act 1978*, which enables each State to increase or reduce personal income tax levied on residents of the State.
- (f) *International Organizations (Privileges and Immunities) Act 1963*, and Regulations made under that Act, which provide for the exemption from income tax of certain income of international organisations and their officials.
- (g) *Diplomatic Privileges and Immunities Act 1967*, which provides for the exemption from income tax of certain income of diplomatic representatives, their staff and families.
- (h) *Consular Privileges and Immunities Act 1972*, which provides for the exemption from tax of certain income of consular representatives, their staff and families.
- (i) *The Loan (Income Equalization Deposits) Act 1976*, which provides for the making of interest bearing income equalization deposits by primary producers with the Commissioner of Taxation.
- (j) *Taxation (Interest on Overpayments) Act 1983*, which provides for the payment of interest on certain refunds of tax.

- (k) *Taxation (Interest on Underpayments) Act 1986*, which imposes an interest charge in respect of underpayment of income tax.
- (l) *Loan (Drought Bonds) Act 1969*, which authorizes the issue of drought bonds and empowers the Commissioner of Taxation to declare when drought bonds have become redeemable.
- (m) *Banking Act 1959* and Regulations, under which certain exchange control applications are screened to prevent avoidance and evasion of Australian taxes.
- (n) *The Crimes (Taxation Offences) Act 1980*, which established a number of criminal offences relating to the fraudulent evasion of income tax (and sales tax) by stripping companies or trusts of their capacity to pay.
- (o) *Medicare Levy Act 1986*, which imposes medicare levy on certain individuals subject to assessment of the levy in accordance with the Assessment Act.
- (p) *Local Government (Personal Income Tax Sharing) Act 1976*, which provides for local government bodies in the States to receive a specified proportion of net personal income tax collections.

More detailed information on taxation can be obtained from the Australian Taxation Office's reports and papers.

(a) Assessments in respect of 1984-85 income year issued during the period 1 July 1985 to 30 June 1986. (b) Net income is total assessable income less total deductions for expenses incurred in gaining assessable income. (c) Taxable income is the income remaining after deducting from assessable income all allowable deductions.

The previous table excludes details of assessments raised to trustees. However, the following table includes all 1984-85 income year assessments issued during the period 1 July 1985 to 30 June 1986.

## State governments

The State government enterprises dealt with in this section include the central government of each State, statutory bodies created by or under State legislation to carry out activities on behalf of the central government, and incorporated organisations in which individual State governments have a controlling interest.

The transactions of many of the State government enterprises are itemised in State Consolidated Revenue Funds or in Trust Funds, so that a satisfactory coverage of their transactions can be obtained from a detailed analysis and reclassification of the published

accounts whose receipts and payments are summarised in the Statement of Treasury balances for each State. The remaining statutory bodies and other publicly owned or controlled organisations maintain accounts entirely, or largely, separate from the public accounts, although there may be transactions between them and State governments (such as advances and capital contributions, interest and dividends, and votes for running expenses and capital works) which would affect the public accounts. The accounting reports of this group of organisations have to be collected and analysed in order to present a complete statement of the transactions of State government enterprises—or at least methods of analysis need to be adopted which adequately reflect their transactions so that they are in principal, covered by the statistics.

In the figures which follow in this section, all expenditure by State central government enterprises on certain institutions, whether direct (e.g. new building charged to Loan Fund) or indirect by way of current or capital grants to the bodies administering them, has been treated as final expenditure on goods and services by State government; fees and gifts from persons or private businesses to these institutions are not included, nor is the expenditure of the institutions from their own resources. Universities and hospitals are particular examples of organisations for which this practice has been adopted.

Many of these State government enterprises have been granted autonomy by State legislatures to the extent that they are largely financially independent. Some of these are funded from earmarked tax revenues and are vested with independent borrowing powers. A considerable number of others belong to the category of public trading enterprises, since they are able to charge for their services so as to cover their costs of operation. These bodies have usually been created to control a specific activity or provide a specific service within a State. It is often the case that in other States similar activities are carried out, or services are provided, by central government or local governments. Details of the activities of autonomous or semi-autonomous State government enterprises engaged in such fields as construction and maintenance of roads and bridges, provision of water supply and sewerage services, harbour facilities, transport, electricity and gas, housing and banking may be found in chapters relevant to those subjects and in *State Year Books*.

Details of the transactions of State governments are given in the tables which follow and in *State and Local Government Finance, Australia* (5504.0). Additional information relating to the activities of the State governments may also be found in the *Year Books* of the individual States.

### Outlay, revenue, grants received, and deficit

The outlay, revenue, grants received and deficit of State governments for the six year period ended 1985-86 are given in the following table.

#### OUTLAYS, REVENUE AND GRANTS RECEIVED, AND DEFICIT OF STATE GOVERNMENTS (\$ million)

|                                                            | 1980-81 | 1981-82 | 1982-83 | 1983-84 | 1984-85 | 1985-86 |
|------------------------------------------------------------|---------|---------|---------|---------|---------|---------|

For more recent information on State government finance statistics, reference should be made to the publications listed in the bibliography at the end of this chapter.

### Local governments

In each State of Australia and in the Northern Territory there exists a system of local government whose powers and responsibilities are generally similar and cover such matters as the construction and maintenance of roads, streets and bridges; water, sewerage and drainage systems; health and sanitary services; the supervision of building; and the administration of regulations relating to items such as weights and measures, slaughtering, the registration of dogs, etc. In addition to these obligatory functions, there are also many which may be performed by a local authority either with or without the consent of the ratepayers or the Governor-in-Council. These include transport facilities, electricity, gas and other business undertakings, hospitals, charitable institutions, recreation grounds, parks, swimming pools, libraries, museums, etc.

The system is based on the principle of a grant of specific powers by the State and Northern Territory legislatures to the local government bodies, their autonomy, however, being more or less limited by the provision for general supervision by a department of the central government or by the Governor-in-Council. Otherwise, within the scope of the Acts under which they are constituted or which they have to administer, they are responsible only to the ratepayers. While the broad pattern of local government throughout the States of Australia is similar, the range of activities, election of officers, methods of valuation and rating powers, etc. vary considerably from State to State, and even within States.

The areas over which local government bodies, numbering almost 900, exercise general control, are known in New South Wales as cities, municipalities and shires; in Victoria as cities, towns, boroughs and shires; in Queensland as cities, towns and shires; South Australia as cities, corporate towns and district council areas; in Western Australia as cities, towns and shires and in Tasmania and the Northern Territory as cities and municipalities. In New South Wales some local authorities in an area have combined to form County Councils which provide services such as electricity and water supply. Within shires there are also some municipal units known as urban areas. Apart from the Australian Capital Territory and the more sparsely populated parts of New South Wales, South Australia and the Northern Territory, practically the whole of Australia comes within local government jurisdiction. For further details see *State Year Books*.

## Area, population, dwellings, and rates and penalties for ordinary services

The area, population, dwellings, and the amount of rates and penalties collected for ordinary services in the incorporated areas of each State are shown in the following table. Particulars of dwellings are in accordance with the definition used in the Census, and are compiled from information collected on the Census Schedules. In the table, where the boundary of a capital city statistical division cuts across a local government area, the area of that capital city statistical division has been estimated. Particulars of population for capital city statistical divisions take account of those local government areas which overlap with capital city statistical division boundaries.

The item 'Rates and Penalties for Ordinary Services' relates to general and other special or local rates (excluding water and sewerage rates) levied or declared or, where the cash accounting system operates, the rates collected.

For more recent information on local government finance statistics, reference should be made to the publications and statistical services listed in the bibliography at the end of this chapter.

### All levels of government

In the following table the transactions of the Commonwealth, State and local governments have been brought together and consolidated to provide details of the outlays and revenue of the public non-financial sector as a whole.

#### Summary of outlays, revenue and deficit

The outlays, revenue and deficit of all governments for the years 1980-81 to 1985-86 are set out in the following table.

### OUTLAYS, REVENUE AND DEFICIT OF COMMONWEALTH, STATE AND LOCAL GOVERNMENTS(a)

(\$ million)

|                                                  | 1980-81 | 1981-82 | 1982-83 | 1983-84 | 1984-85 | 1985-86 |
|--------------------------------------------------|---------|---------|---------|---------|---------|---------|
| Current outlay                                   | 41,483  | 48,286  | 56,963  | 65,598  | 74,823  | 83,550  |
| General government final consumption expenditure | 21,664  | 24,937  | 28,405  | 31,990  | 35,848  | 39,946  |

(a) Excludes financial enterprises.

### Public sector borrowing

Figures given in this section do not purport to show either 'public debt' or 'net public debt', but are designed to provide details of securities issued on behalf of the Commonwealth Government, the States and the Northern Territory together with some details of the amounts borrowed by State, Territory and local governments with independent borrowing powers.

For a number of reasons, this information cannot be aggregated, without adjustment, to provide a measure of the 'debt' of public sector enterprises. There are forms of debt not evidenced by the issue of securities, such as Commonwealth Government advances to the States and Northern Territory for specific capital purposes. Governments themselves maintain significant holdings of their own securities; for example, the Commonwealth Government, in the National Debt Sinking Fund, the Loan Consolidation and Investment Reserve, and in other Trust Funds, holds large investments in securities issued either directly by itself or on behalf of the States and the Northern Territory. Some of the securities issued on behalf of the States and held by the Commonwealth Government represent the proceeds of overseas loans, securities for which were issued directly by the Commonwealth Government, the Australian currency counterpart proceeds of the loans being invested in special loans to finance State and Northern Territory works programs. A number of State and Northern Territory public corporations and local governments also maintain significant investments in government securities (including their own securities). Aggregation of the figures for securities on issue which follow would clearly involve a substantial degree of duplication; the sum of securities on issue therefore cannot be regarded as representing 'net public debt'.

### Commonwealth Government and States and the Northern Territory: government securities on issue

Under the 1927 Financial Agreement between the Commonwealth Government and the States (as amended to 1976), the Commonwealth Government accepted responsibility for the securities of State governments then on issue and was empowered to arrange for all future borrowings on behalf of the Commonwealth and the States and to issue Commonwealth Government securities for all moneys borrowed.

During 1985-86, an agreement was reached with the Northern Territory Government for the formal allocation of securities relating to the Northern Territory Government's Borrowing program and associated (nominal) debt allocations.

A National Debt Sinking Fund, which is administered by the National Debt Commission, was established by the *National Debt Sinking Fund Act, 1923* for the redemption of securities issued on behalf of the Commonwealth Government. Under the terms of the Financial

Agreement, the sinking funds existing in respect of the States' debts were also placed under the control of the Commission. The Commonwealth Government is reimbursed by the States and the Northern Territory for interest, exchange, etc. paid on their behalf, and the securities are redeemed from the Fund to which both the Commonwealth, the State government and the Northern Territory (from 1985-86) make pre-determined contributions. The amounts to be contributed were varied when the *National Debt Sinking Fund Act, 1966* repealed all previous legislation on sinking funds relating to securities on issue on behalf of the Commonwealth Government, and again in 1976 when the Act was amended to reflect the amendments to the Financial Agreement. In 1976, the Commonwealth assumed the responsibility for over \$1,000 million of States' debt existing as at 30 June 1975. As a consequence, the separate States' Sinking Funds were absorbed into the National Debt Sinking Fund, with separate accounts being maintained for the Commonwealth and each State and the Northern Territory.

For further information relating to the recent operations of the National Debt Sinking Fund reference should be made to the fifty-seventh annual report of the National Debt Commission. Particulars of the creation and operation of sinking funds by the *National Debt Sinking Fund Act, 1923* are included in issues of the *Year Book* prior to No. 23, and a general description of the provisions applying between 1966 and 1976 is given in issue No. 61.

In the tables which follow, details are given of transactions in Commonwealth Government securities issued on account of the Commonwealth Government, the States and the Northern Territory from 1985-86. Amounts relating to overseas loans are shown in Australian currency equivalent calculated on the basis of the rates of exchange ruling at 30 June in each year shown. All amounts are at face value.

For figures which permit accurate analysis of the structure and movement of securities issued on behalf of the Commonwealth and States, refer to the Commonwealth Budget Paper No. 8, *Government Securities on Issue*.

### Net movement in securities on issue

Summary details of the net movement in securities issued for Commonwealth Government purposes and on account of the States during the period 1981-82 to 1986-87, are given in the following group of tables.

#### NET MOVEMENT IN GOVERNMENT SECURITIES ON ISSUE (\$ million)

(a) Recorded in Commonwealth Government Loan Fund as State domestic raisings. (b) Loans taken over from the previous Canberra Commercial Development Authority. (c) Australian currency equivalent at rates of exchange ruling at 30 June in each of the years shown. (d) Includes conversions from one type of security to another, which affect the net movements of individual loan categories, but do not affect the overall net movement.

NOTE: For securities repayable in overseas currencies the amounts shown also include an element due to exchange rate variations in Securities on Issue.

**Government securities on issue**

The following table provides details of government securities on issue on account of the Commonwealth Government, the States and the Northern Territory, repayable in Australian and in overseas currencies.

**GOVERNMENT SECURITIES ON ISSUE: COMMONWEALTH GOVERNMENT AND STATES  
AND NORTHERN TERRITORY**  
(*\$ million*)

(a) Includes loans taken over from the previous Canberra Commercial Development Authority. (b) Australian currency equivalent.

### State and local authorities' borrowings

The borrowings of Commonwealth, State and local authorities first came within the purview of the Loan Council under a 'gentlemen's agreement' originating in 1936. Since 1984–85 the 'gentlemen's agreement' has been replaced by the Global Approach whereby the Loan Council determines a voluntary global limit to apply to all new money borrowings by all public trading enterprises (except statutory marketing boards) and local governments. Details of the Global Approach are contained in Commonwealth Budget Paper No. 7 *Payments to and for the States, the Northern Territory and Local Government Authorities*.

The following table shows the aggregate borrowings by the State and local authorities in each of the years 1983–84 to 1987–88.

(a) Includes borrowings by all Commonwealth, State and Northern Territory semi-government and local authorities, government-owned companies and trusts. (b) Includes 'conventional' loan raisings under the Gentlemen's Agreement for 1983-84, and within the global limits thereafter. (c) Includes borrowings by way of domestic deferred payments, overseas trade credits, financial leases, sale and leaseback and similar arrangements, security deposits and other repayable capital contributions, and identified net changes in temporary purpose borrowings over the financial year. (d) Commonwealth Treasury estimates. (e) Negative reflecting a decline in temporary purpose borrowings outstanding over the course of 1984-85. (f) Includes 'implicit' borrowings associated with the Commonwealth's instalment purchase of Commonwealth Government Offices. (g) Includes unexpected net increase in temporary purpose borrowings of \$54.9 million. (h) 'Global' new money limits agreed by Loan Council at its May 1987 Meeting.

Additional details of the transactions of public authorities engaged in particular fields of activity, such as defence, transport and communication, health and welfare, education, etc., may be found in other chapters of this *Year Book*.

# THE DEVELOPMENT OF COMMONWEALTH-STATE FINANCIAL ARRANGEMENTS IN AUSTRALIA

*(This special article has been contributed by Professor Russell Mathews)*

This article reviews the development of Commonwealth-State financial arrangements in Australia, with special reference to the assignment of powers, taxation, grants arrangements, and public sector borrowing. References to the Australian States should be taken to include the Northern Territory, which has been self-governing since 1978. The Australian Capital Territory continues to be administered by the Commonwealth (Federal) Government.

## **The assignment of taxing, borrowing and expenditure powers**

The Commonwealth Constitution gives the Commonwealth and the States concurrent powers over all forms of taxation other than customs and excise duties, which are exclusive to the Commonwealth. Except for rents or royalties from offshore minerals, which the Commonwealth has agreed to share with adjoining States, the States control natural resource revenues resulting from the reservation of mineral rights for the Crown. States are also able to derive revenues from resource development indirectly, for example through charges for rail or electricity services. Although generally precluded from granting any bounties on the production or export of goods, this restriction does not apply to metals, and States are able to subsidise mineral production indirectly through the prices they charge for services. For its part, the Commonwealth has been able to control some mining operations indirectly by refusing to grant export licences; it also has the power to impose export taxes.

Commonwealth and State governments originally had concurrent powers with respect to borrowing and the public debt. However, following a financial Agreement between the Commonwealth and States in 1927, the Constitution was amended to establish the Australian Loan Council with the power to control the amounts, terms and conditions of most Commonwealth and State borrowing in Australia. For reasons discussed below, the Commonwealth has exercised a large measure of control over the Loan Council and hence over public sector borrowing.

Under the Commonwealth Constitution, the Commonwealth Government has the responsibility for those functions of government which are international in character (such as defence and foreign affairs), involve national matters (such as citizenship and currency) or have interstate ramifications (such as activities extending beyond the limits of individual States). The States have the formal responsibility for most aspects of law and order, social services, local government, community and economic services, and resource development. However, in many of these areas responsibility is shared between the Commonwealth and the States depending on whether the activities have international or interstate dimensions or are confined within individual States. Thus international and interstate trade and commerce, conciliation and arbitration in relation to industrial disputes extending beyond the limits of any one State, and banking other than State banking within a State are the subject of Commonwealth powers while similar activities within States are controlled by State laws. In addition, the Commonwealth has used its financial powers, especially a general grants power whereby it can provide financial assistance to States on such terms and conditions as it sees fit, to involve itself in various ways in functions such as education, health and transport which are formally State responsibilities. Both in this way and as a result of the interdependence of the two levels of government in relation to many areas of decision making, there is a significant degree of sharing of responsibility for social and economic policies.

Although the Constitution does not distinguish between the economic stabilisation, income distribution and resource allocation functions of government, the Commonwealth has assumed primary responsibility for the first two while the States retain a large measure of control over resource allocation decisions within the public sector. While the Commonwealth and the States both exercise important regulatory functions (again depending on whether activities are international/interstate or intrastate), the States and their local governments undertake

most of the final expenditure by the public sector on goods and services. The Commonwealth's budget is to a large extent a redistributive mechanism or clearing house for making financial transfers between and within the private and public sectors. Some 80 per cent of total Commonwealth outlays consist of transfer payments to persons or families, and payments to State or local governments.

The Commonwealth has explicit constitutional responsibility for the provision of cash social service benefits. This, combined with its involvement through grants to the States, means that the Commonwealth shares responsibility for social welfare with the States, which have the task of organising the direct provision of education, health, housing and other social services.

The Commonwealth and the States both operate business undertakings in fields such as banking, transport, electricity and gas, and water supply. The Commonwealth has constitutional responsibility for postal and telecommunication services.

## Taxation

Customs and excise duties provided more than three-quarters of colonial tax revenues at the time of Federation. Although these duties then became exclusive to the Commonwealth, the Constitution required at least three-quarters of the revenues derived from them to be paid to the States during the first ten years of Federation. However, first the States and then, during World War I, the Commonwealth began to exploit personal and company income taxes on a significant scale. The aggregate amount of Commonwealth and State income taxes still did not exceed the revenue from customs and excise duties at the commencement of World War II, but by then the States were collecting nearly three-quarters of all income taxes. Attempts to co-ordinate income tax arrangements during the 1920s, including a proposal by the Commonwealth that it should withdraw altogether from personal income taxes in exchange for the abolition of its general revenue grants to the States and the retention of its right to levy company taxes, had failed, except for the introduction of joint collection arrangements in 1923.

In 1942 the Commonwealth, faced with the problem of financing a massive war effort from an income tax base which could not be fully exploited because of widely differing State rates, introduced uniform tax legislation which gave it a monopoly over all income taxes. It did this by imposing rates which were as high as to preclude the continuation of State income taxes, and at the same time providing for tax reimbursement grants to be paid to the States so long as they refrained from levying their own income taxes.

As part of new tax sharing arrangements introduced in 1976 (which are discussed below in the section on grants), the Commonwealth made provision for State personal income tax subcharges to be collected by the Commonwealth on behalf of the States or for State rebates to be granted at their expense, on the basis of a continuation of uniform assessment and collection. So far no State has taken advantage of this provision.

The other factor which has played a decisive role in the distribution of taxing powers has been a series of decisions by the High Court, which have had the effect of excluding the States from sales taxes on goods on the grounds that they are excise duties, which under the Constitution are exclusive to the Commonwealth.

The result has been that the States have been denied access to the most important direct and indirect revenue sources available to states or provinces in other federations. The Australian tax system has become one of the most highly centralised in the world, with the Commonwealth collecting some 80 per cent of all taxes and the States only about 16 per cent (the remaining 4 per cent representing local taxes). There has also been a vertical separation of taxes as between the Commonwealth and State/local taxes, as well as a revenue gap with neither level of government imposing a broad-based consumption tax or, since their abolition during the 1970s, death duties. Likewise, there are no general taxes on capital or capital accretion at either the Commonwealth or State level. Only recently has the Commonwealth begun to tax capital gains on a systematic basis.

The principal Commonwealth taxes are thus individuals and company taxes (which provide more than two-thirds of total Commonwealth tax revenue), customs and excise duties, and a selective and differentiated wholesale sales tax. The principal State taxes are pay-roll tax (transferred by the Commonwealth in 1971 to alleviate the fiscal imbalance between the two levels of government), stamp duties, motor taxes, business franchise taxes, liquor taxes, gambling taxes, levies on statutory corporations and land tax.

## Grants arrangements

Commonwealth-State grants may take the form of either general purpose or specific purpose grants. Both may include grants for recurrent as well as capital purposes, both may have conditions attached to them and both may include fiscal equalisation provisions.

### General purpose grants

Although the Commonwealth was required to share its customs and excise revenues with the States during the first ten years of Federation, the initial general purpose grants strictly defined commenced in 1910-11 and took the form of equal per capita payments (of \$2.50) to all States. These continued until 1926-27, after which they were replaced by specific purpose grants in the form of debt charges assistance as part of a general financial adjustment under the Financial Agreement.

The principal general purpose grants in Australia during recent years have been those which resulted from the uniform income tax arrangements referred to in the previous section. The tax reimbursement grants which commenced in 1942-43 were succeeded by financial assistance in 1959-60, whereby the aggregate level of grants was increased each year in accordance with a formula that had regard to changes in population and wage rates and a so-called betterment (or real growth) factor. In 1976-77, the financial assistance grants were replaced by what were called, first, tax sharing entitlements and, later, tax sharing grants, the aggregate level of which depended, subject to varying guarantee provisions, on Commonwealth personal income tax collections and, later, Commonwealth total tax collections. In 1985-86, however, the Commonwealth's principal general purpose grants to the States again came to be called financial assistance grants, with provision for escalating them each year in such a way as to achieve Commonwealth-designated changes in real terms.

The basis of a distribution of the foregoing general purpose grants is considered below. Since 1970-71, the Commonwealth has also been making general purpose capital grants to the States; these also are discussed below.

### Specific purpose grants

The first important specific purpose grants from the Commonwealth to the States, which were for roads, commenced in 1923. As noted above, these were followed from 1927-28 by debt charges assistance under the Financial Agreement. After World War II, the Commonwealth began to make grants for such purposes as universities, tuberculosis and mental hospitals, railways and economic development. Advances were also made for housing at subsidised interest rates.

The 1960s and early 1970s were years of acute financial crisis for State governments. Ever since the introduction of uniform taxation, they had been squeezed between the opposing forces of inadequate revenue sources and growing costs of education, health, transport and other services for which they were responsible. In addition to their attempts to have the financial assistance grants increased, therefore, they also actively sought specific purpose grants or accepted assistance when offered. The scope and size of specific purpose programs increased steadily throughout this period. In the years from 1972-73 to 1975-76, specific purpose payments to State and local governments more than quadrupled in money terms, growing from one-quarter to total payments to nearly half.

Existing programs were continued and many new programs were commenced, commissions and other statutory bodies being used to advise on the needs of tertiary education institutions, schools, children's services, hospitals and health services, social welfare, the national heritage, cities and roads. The Commonwealth Grants Commission was given the task of advising on financial assistance for local government. The Commonwealth also assumed full financial responsibility for higher education and took over some State railway systems.

The rapid growth in specific purpose payments eased the States' financial problems and made it easier for them to finance the burgeoning costs of education, health and the other services for which they were responsible, while paradoxically placing the Commonwealth's own budget under increasing strain. There were continuing disputes between the two levels of government about the planning and administration of programs, as well as serious weaknesses in the Constitution. The operation of the advisory commissions also caused problems including defining their relationship to the Commonwealth Government and Parliament, duplication of their activities with those of Commonwealth and State departments, failure to integrate their recommendations in the normal budget processes, virtual freedom

from financial constraints and arbitrary methods of distributing the funds among the States. They did not operate as intergovernmental co-ordinating agencies, even though they were advising on financial assistance to States for purposes which were State constitutional responsibilities.

Within a few years after their establishment, most of the specific purpose commissions were abolished or absorbed into Commonwealth departments, leaving only the Commonwealth Tertiary Education Commission and the Commonwealth Schools Commission with major advisory responsibilities in relation to specific purpose grants. They were now required to operate within designated Commonwealth policies and budgetary guidelines, so that they were concerned chiefly with advising on the relative needs of the educational institutions for which the Commonwealth's financial assistance was being provided.

After 1975, many specific purpose programs were abandoned or run down (especially those related to urban affairs, social welfare, housing and transport), while some of the major health programs were consolidated into block grants which the Commonwealth has announced will be absorbed into financial assistance grants after 1988. The education grants were roughly maintained in real terms, and during recent years there has been a resurgence of specific purpose payments for social welfare, housing and roads so that the aggregate level of this form of assistance remains high. The States continue to have little influence over the form, administrative procedures and conditions attaching to specific purpose programs. However, the lack of stringent revenue conditions has meant that they have generally been able to substitute grants for their own revenue raising, giving them greater revenue flexibility and not significantly impeding their own determination of budget priorities. Even when health grants are excluded, specific purpose payments continue to account for about two-fifths of all Commonwealth payments to the States.

#### **Equalisation grants**

What came to be called special grants were paid to financially weaker States, commencing in 1910-11 for Western Australia and being extended to Tasmania and South Australia in 1912-13 and 1929-30 respectively. Initially the claims for specific grants were based on disabilities associated with federal tariff, maritime, arbitration and other policies, but the grants tended to be arbitrarily determined on the basis of political decisions or following ad hoc parliamentary or other inquiries.

Secession movements developed in the three States during the early 1930s as a consequence of disaffection with the effects of Federation. In Western Australia, a secession referendum which had the support of the State Government was passed with a two-thirds majority in 1933. There was, however, no provision in the Commonwealth Constitution for secession by a State and the British Parliament declined to take any action in response to a Western Australian petition. A month after the referendum, the Commonwealth Parliament established the Commonwealth Grants Commission to inquire into and report on applications by the States for special financial assistance.

In its Third Report in 1936, the Commission decided that the financial need of a State, and not any disabilities it suffered as a result of Federation or Commonwealth policies, should be the principle used to determine whether or not a State should receive a special grant. In accordance with this principle and following annual reviews, special grants were paid to the three financially weaker States on the recommendation of the Commission; the Commission's recommendations with respect to special grants were always accepted by the Commonwealth Government.

The principle of financial need was subsequently modified until eventually the special grants became fiscal capacity equalisation grants, defined as the amounts considered necessary to enable the States seeking assistance (so-called claimant States) to provide comparable services to those being provided by the standard States (eventually New South Wales and Victoria, the States with the highest fiscal capacity), subject to them also imposing taxes and charges at comparable levels. The claimant States remained free to determine the levels and pattern of revenue raising and expenditure in accordance with their own policies, so that the special grants had the effect of reconciling equality with the diversity and decentralised decision making which are the distinguishing characteristics of a federal system.

The introduction of uniform income taxation in 1942 complicated the task of assessing special grants, since it now became necessary for the Commission to take into account the distribution of the tax reimbursement grants (later financial assistance grants) among the States as well as its assessments of the revenue and expenditure needs of the claimant States.

Except for a brief period towards the end of the 1950s, when those grants were distributed on a basis very close to equal per capita, the distribution came to reflect ad hoc political decisions and it became possible for the three financially weaker States to receive such favourable shares of the financial assistance grants as to make them ineligible for special grants. At varying times after 1959, South Australia, Western Australia and Tasmania ceased applying for and receiving special grants, although South Australia subsequently became a claimant State again between 1970 and 1974 and Queensland applied for and received special grants from 1971 to 1982, when all States agreed not to apply for special grants following reviews of the tax sharing relativities of all States by the Grants Commission.

The first review of tax sharing relativities, which was undertaken as part of the tax sharing arrangements which commenced in 1976, was completed in 1981. The Grants Commission was required to apply the fiscal equalisation principle. For this purpose, it developed a model which would distribute the total funds being provided to the States on the basis of equal per capita shares adjusted for differences in the costs of providing standard services, difference in the capacities to raise revenues from the application of a standard revenue effort, and differences in the per capita amounts of relevant specific purpose grants.

The Commission's assessments implied that, to achieve fiscal equalisation, there should be significant shifts away from the existing distribution of the tax sharing grants to the advantage of the three most populous States—New South Wales, Victoria and Queensland—and to the disadvantage of the other three States. Only marginal changes to the distribution were made following the 1981 review and a further review by the Commission that was completed in 1982, but after another review completed in 1985 State relativities were changed in line with the Commission's assessments so that State financial assistance grants are now being distributed on a fiscal equalisation basis. Another triennial review by the Commission commenced in 1986 for report by 1988.

The present arrangements for distributing financial assistance grants preclude State applications for special grants, but the Northern Territory continues to be eligible for such grants until 1988, after which it will be brought fully into the State financial assistance grants arrangements. In 1986 the Commonwealth asked the Grants Commission to report on whether the amounts of financial assistance received by the Territory in 1983–84 and 1984–85 exceeded the amounts necessary to provide standard services at standard rates of revenue raising.

Among its other tasks, the Grants Commission has also reviewed the finances of the Australian Capital Territory by reference to fiscal equalisation principles, reporting first in 1984 and again in 1986.

### **Public sector borrowing**

The Australian Constitution made provision for the Commonwealth to take over State debts existing at the time of Federation, and this was extended by the Constitutional amendment in 1910 to permit the takeover of all State debts and not merely those which existed in 1901.

During the 1920s, arrangements were made to co-ordinate public sector borrowing through the establishment of an informal Loan Council, but the Commonwealth remained unwilling to accept responsibility for State debts as long as the States were free to determine their own borrowing policies independently. Arguments about the assignment of income tax powers between the two levels of government, and about the continuation of the \$2.50 per capita grants which the Commonwealth had been making as general revenue payments to the States since 1910, eventually coalesced with the arguments about debt management and borrowing arrangements and resulted in the Financial Agreement of 1927. This provided for: the establishment of the Australian Loan Council as the body formally responsible for Commonwealth and State borrowing; the takeover of State debts by the Commonwealth while leaving the States with the obligations to indemnify the Commonwealth for interest and sinking fund payments on those debts and on all future borrowing now to be undertaken by the Commonwealth on their behalf; and the replacement of the per capita grants by debt charges assistance to be linked with sinking fund arrangements. Following Constitutional amendment in 1928, these provisions of the Financial Agreement became formally embodied in the Constitution.

Following a so-called Gentleman's Agreement in 1936, the Loan Council's control was extended to local and semi-government authorities, so that henceforth all public sector

borrowing, other than borrowing for defence or for temporary purposes, came under its jurisdiction.

During the Great Depression the Loan Council and its alter ego, the Premier's Conference, played a decisive role in the determination of economic and fiscal policy, with the States exercising control jointly with the Commonwealth. After the introduction of uniform taxation in 1942, however, the Commonwealth came to dominate the Council and henceforth decisions about the amounts and conditions of public sector borrowing, like other key elements of fiscal policy, were effectively made by the Commonwealth Government. The Commonwealth achieved this domination by a combination of its income tax monopoly, its control over the Reserve Bank, its use of the grants power and its underwriting of State loan programs through so-called special loans. These were provided to the States, on the same terms as public loans, to make up any shortfall in public loan raising in respect of approved programs. The price for the States was that the amounts and terms of all loan raising—not only by State governments but also by their semi-government and local authorities—were now determined by the Commonwealth, and the States increasingly became indebted to the Commonwealth as special loans proved to be necessary in nearly every year between the early 1950s and the early 1970s.

There were some adjustments to the borrowing and debt arrangements in the early 1970s, involving, first, the progressive takeover by the Commonwealth of \$1,000 million of State debts and the charges thereon and, second, the substitution of capital grants by the Commonwealth for approximately one-third of the approved State Loan Council programs. The Commonwealth also began to pass the State programs through its own budget, providing itself with an incentive to impose tight restraints on the size of the programs as it began to incur large deficits of its own in the second half of the 1970s and the 1980s. Over a ten-year period the real value of the State Loan Council programs was halved.

During the same period, however, there was a relaxation of controls over State semi-government and local borrowing, involving a series of decisions by the Loan Council designed mainly to facilitate the financing of resource development. These included: so-called infrastructure financing, whereby loans for individual development projects were approved between 1978 and 1981; the freeing of electricity authority borrowing from Loan Council control from 1982; and the progressive deregulation of borrowing by other authorities—as to both amounts and terms and conditions—from 1983. From 1982, also, States were permitted to establish central borrowing authorities to co-ordinate and consolidate borrowing by their authorities.

The States had been responding to the restrictions on their own Loan Council programs by resorting to a wide range of non-conventional forms of borrowing. These included: security deposit arrangements, whereby State governments required private companies involved in resource development to finance public sector infrastructure such as railway and port construction; leasing arrangements; commercial buyer or supplier credit; deferred payments; instalment purchasing; and export credits. As a result borrowing outside approved Loan Council programs accounted for about 60 per cent of total net borrowing by 1983-84. In order to restore Loan Council oversight over authority borrowing, the Gentlemen's Agreement was suspended in 1984 in favour of a so-called global approach, whereby the Commonwealth and State Governments agreed to voluntarily limit authority borrowing from all sources to global limits agreed by the Council. In 1985 the Gentlemen's Agreement was formally terminated, so that the global approach now forms the basis of the Loan Council's oversight of authority borrowings, albeit with the States exercising a greater influence over the decisions taken. Interest rates and other terms and conditions are now left to individual governments and the market to determine.

## Conclusion

It is possible to identify three phases in the development of Australian Commonwealth-State financial arrangements, involving what maybe called co-ordinate or decentralised federalism, co-operative federalism and centralised federalism respectively.

The first period, from 1901 to the 1920s, saw the Commonwealth and the States carrying out their fiscal responsibilities largely independently of each other, in accordance with the powers assigned severally to them by the Constitution.

The first period, from 1901 to the 1920s, saw the Commonwealth and the States carrying out their fiscal responsibilities largely independently of each other, in accordance with the powers assigned severally to them by the Constitution.

The period of co-operative federalism, which commenced during the 1920s and ended in 1942, was marked by the establishment of the Australian Loan Council and the Commonwealth Grants Commission, the sharing of fiscal responsibilities during the Great Depression of the 1930s and the establishment of the first Commonwealth-State ministerial councils, such as the Australian Agricultural Council, to co-ordinate policies in fields of common interest.

Centralised federalism commenced in 1942 with the uniform tax legislation and has been distinguished by Commonwealth domination over the Loan Council, constitutional amendments and judicial decisions which have had the effect of extending Commonwealth powers, the consolidation of a highly centralised taxation system, the substitution of Commonwealth general purpose grants for State income taxes, and the use of specific purpose grants on a massive scale to facilitate Commonwealth involvement in expenditure responsibilities for which the States are formally responsible under the Constitution.

At the time of Australia's bicentenary, there are some signs that some of these centralising tendencies may be relaxed or even reversed. The States have regained a degree of influence in the Loan Council within what is now a largely deregulated system of loan raising; they have access to income taxes if they choose to levy surcharges; the scale of Commonwealth general purpose and specific purpose grants during recent years has, paradoxically, substantially strengthened their fiscal positions at the expense of the Commonwealth; the recent work of the Commonwealth Grants Commission has resulted in a large measure of horizontal fiscal equalisation; and there has been a diminution in the importance of specific purpose grants relative to other funds available to the States. But the main impetus towards decentralising tendencies in Australia's federal financial arrangements is likely to come from the developing weakness in the Commonwealth's own budgetary position, as it endeavours to grapple with large deficits, contain the growth of government expenditures and reform the taxation system.

## NATIONAL ACCOUNTS

**The historical setting**

National accounting aims to provide a systematic summary of the transactions taking place in the economy, especially those that relate to the production and use of goods and services, and to transfers of income or capital between sectors of the economy.

Official estimates of Australian national income were first published in *The Australian Balance of Payments, 1928-29 to 1937-38*. The estimates used for this publication were, with only minor adjustments and revisions, those which had been produced in 1938 by Clark and Crawford for the years 1928-29 to 1935-36 but updated to 1937-38. Before this however, various estimates of Australian national income had been produced by a number of individuals. The first set of national accounts compiled by the ABS was published in the 1945 Budget White Paper *Estimates of National Income and Public Authority Income and Expenditure* and covered the period 1938-39 to 1944-45. The accounts were presented in a double-entry accounting form, showing a balance between gross national product and gross national expenditure.

The first major changes to the annual national accounts occurred in 1963 with the introduction of the annual publication, *Australian National Accounts, National Income and Expenditure* (5204.0). The contents, structure and presentation of the accounts were changed, with a considerable number of revisions being made to estimates published previously. Some of the revisions resulted from conceptual and definitional changes affecting the principal accounting aggregates, while others were due to the introduction of a new series of estimates for particular items which affected all years. Included for the first time with the 1963 accounts were constant price annual estimates of the principal expenditure aggregates.

The original United Nations *System of National Accounts and Supporting Tables*, published in 1953, was the first phase in the establishment of an internationally accepted framework within which the statistical information needed to analyse the economic process could be organised and related. Subsequent development of the accounting framework and its supporting concepts culminated in the publication by the United Nations in 1968 of detailed international standards for national accounting systems. In the 1971-72 issue of the *Australian National Accounts: National Income and Expenditure*, the structure of the accounting system was revised to accord more closely with the new international standards, concepts and definitions. An additional objective of the 1971-72 revisions was to align estimates of existing accounting aggregates with internationally reported aggregates following Australia's decision to join the Organisation for Economic Co-operation and Development (OECD).

Quarterly estimates of national income and expenditure were developed to provide more current indicators and to permit better analysis of the short-term behaviour of the economy and changes in trends in important variables. Quarterly estimates for Australia were first published in December 1960 for the period September quarter 1958 to September quarter 1960. The estimates were consistent with the annual figures published with the Commonwealth Government Budget in August 1960. *Quarterly Estimates of National Income and Expenditure, Australia* (5206.0) has been issued for each subsequent quarter. The definitions and concepts underlying the quarterly and annual accounts are identical. Seasonally adjusted series were presented first in the September 1967 edition. Quarterly series at constant prices were initially published in a supplement to the December 1970 edition, while seasonally adjusted constant price estimates were introduced in September 1971.

The design and preparation of input-output tables in the early post-war period was an important advance in the development of an integrated system of national accounts. By

bringing intermediate transactions into account, input-output tables complete the description of all non-financial transactions within the economy. In Australia, experimental input-output tables for 1958-59 were published in 1964. Compilation was limited to the use of readily available data. Next in the series, final tables for 1962-63 were published in May 1973. That project laid the foundation for subsequent input-output tables for 1968-69; the final results were published in November 1977. The 1968-69 methodology followed that used in 1962-63 except for several limited modifications. An important feature of the 1968-69 tables was the use of data collected in the first integrated economic censuses conducted in respect of that year. Input-output tables for 1974-75 were the fourth in the series, and used a new Australian input-output estimation methodology. The introduction of the new methodology in 1974-75 enabled the time lag between the reference period and publication of the tables to be reduced and facilitated the introduction of an annual system of input-output tables. The final results were first made available in August 1980. The fifth in the series of input-output tables and the first of the annual tables was for 1977-78. The final results for that year were first made available in December 1982. Tables for subsequent years, up to 1980-81, have since been released.

Estimates of industry gross product at constant prices were presented first in the publication *Estimates of Gross Product by Industry at Current and Constant Prices, 1959-60 to 1965-66*, issued in 1969. This publication was expanded to include estimates of industry gross product at constant prices per person employed, and has been published since 1975. It is now titled *Australian National Accounts, Gross Product by Industry* (5211.0).

In 1981, the first in a series of Occasional Papers on studies in national accounting was issued. Occasional Papers are produced by officers within the National Accounts Branch of the Australian Bureau of Statistics, and report on various aspects of research being undertaken. They are not used for the release of official statistics and do not necessarily reflect the views of the ABS. Nevertheless, they encourage feedback from users regarding proposed new developments within the Australian system of national accounts. A list of the national accounts Occasional Papers produced to date is provided with the bibliography at the end of this chapter.

Two new annual publications, *Australian National Accounts, State Accounts* (5220.0) and *Australian National Accounts, Estimates of Capital Stock* (5221.0) were released in 1987. These publications provide important extensions to the range of national accounts data for Australia. Earlier developmental work in these areas had been reported in various Occasional Papers.

## **Description of national income and expenditure accounts**

A brief description of the conceptual basis of national accounts is given in this section, but for a more detailed treatment of the concepts and structure of the Australian national accounts reference should be made to *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

### **Definition and relationship of the concepts of product, income and expenditure**

The main concepts of product, income and expenditure in the Australian national accounts are defined and expressed in equivalents as follows.

**Gross domestic product** is the total market value of goods and services produced in Australia within a given period after deduction of the cost of goods and services used up in the process of production but before deducting allowances for the consumption of fixed capital. Thus, gross domestic product, as here defined, is 'at market prices'. It is equivalent to gross national expenditure plus exports of goods and services less imports of goods and services. **Gross farm product** is that part of gross domestic product which derives from production in agriculture and services to agriculture. **Gross non-farm product** arises from production in all other industries.

**Gross domestic product at factor cost** is that part of the cost of producing the gross domestic product which consists of gross payments to factors of production (labour, land, capital and enterprise). It represents the value added by these factors in the process of production and is equivalent to gross domestic product less net indirect taxes.

**Domestic factor incomes** is that part of the value added within a given period by factors of production (labour, land, capital and enterprise) which accrues as income to their suppliers after allowing for the consumption of fixed capital. It is equivalent to gross domestic product at factor cost less consumption of fixed capital.

**National income** is the net income accruing within a given period to Australian residents from their services in supplying factors of production (labour, land, capital and enterprise) in Australia or overseas plus indirect taxes less subsidies. It is equivalent to domestic factor incomes plus indirect taxes less subsidies and net income paid overseas.

**National disposable income** is the net income accruing within a given period to Australian residents from their services in supplying factors of production, from net indirect taxes and from net transfers from overseas. It is equivalent to national income less net unrequited transfers to overseas.

**Gross national expenditure** is the total expenditure within a given period on final goods and services (i.e. excluding goods and services used up during the period in the process of production) bought by Australian residents. It is equivalent to the gross domestic product plus imports of goods and services less exports of goods and services.

**Household income** is the total income, whether in cash or kind, received by persons normally resident in Australia in return for productive activity (such as wages, salaries and supplements, incomes of unincorporated enterprises, etc.) and transfer incomes (such as cash social security benefits, interest, etc.). It includes the imputed interest of life offices and superannuation funds, which is the benefit accruing to policy holders and members from investment income of the funds. It also includes third party motor vehicle and public risk insurance claims paid to persons in respect of policies taken out by enterprises. However, it excludes any income which might be said to accrue to persons in the form of undistributed company income. It also includes any property income received by non-profit organisations such as private schools, churches, charitable organisations, etc.

The relationships between these aggregates (other than household income) are illustrated in the following diagram. No conclusions concerning the relative magnitude of various aggregates can be drawn from the diagram, especially as some of the boxes may represent negative values.

**Framework of accounts and sectors**

In the Australian national accounts, four internal sectors are distinguished: corporate trading enterprises (including public trading enterprises), financial enterprises (including the nominal industry), households (including their unincorporated enterprises) and general government. All of these internal sectors engage in productive activity, receive and disburse income and accumulate assets. In this publication no accounts are shown for individual internal sectors. The transactions of the internal sectors are summarised in three accounts: a domestic production account (*see* page 871), a national income and outlay account (*see* page 872) and a national capital account (*see* page 872). In addition, there is an overseas sector having an account (*see* page 873) which shows a summary of the transactions into which overseas governments, persons and businesses enter with Australian residents.

The framework of sectors and accounts underlying the Australian national accounts is set out in the following diagram. The large rectangles depict the minimum system of the four consolidated accounts of the nation. The light rectangles represent the accounts for institutional sectors. The subdivision of the domestic production account represents production accounts for establishments classified according to industry. Selected transactions from such production accounts are shown in *Australian National Accounts, National Income and Expenditure* (5204.0). Input-output tables are produced by developing such production accounts in detail.

**ARTICULATION OF AUSTRALIAN NATIONAL ACCOUNTS**

**Description of the accounts**

The domestic production account is a consolidation of the production accounts of all producers regardless of sector. The production account is shown as receiving revenue from the sale of goods and services to final buyers; all intermediate goods and services are cancelled out, since they represent a cost to one producer to offset the revenue of the other. On the

payments side are shown the payments of indirect taxes less subsidies, and, since the account is presented from the point of view of the producing unit, the wages and salaries paid to employees. The balance is the gross operating surplus which may be divided into consumption of fixed capital and net operating surplus. Consumption of fixed capital is carried to the national capital account (or the sector capital accounts) and net operating surplus, together with wages and salaries and indirect taxes less subsidies, is carried to the national income and outlay account (or sector income and outlay accounts). In input-output tables, the domestic production account is broken up into accounts for separate industries, and transactions associated with intermediate usage of goods and services are shown in the production accounts for the separate industries.

The **national income and outlay account** is shown as receiving wages, salaries and supplements, net operating surplus and indirect taxes less subsidies from the domestic production account. From this income are deducted net payments of income and miscellaneous transfers to overseas; the remainder is the national disposable income. The outlay side of the account shows that this disposable income is largely used for final consumption expenditure and the balance is the nation's saving. The national income and outlay account is a consolidation of the sector income and outlay accounts.

The **national capital account** is a consolidation of the sector capital accounts. It shows on the receipts side consumption of fixed capital transferred from the domestic production account and saving transferred from the national income and outlay account (or from the sector income and outlay accounts). On the payments side are shown purchases by all sectors of new buildings and capital equipment, the increase in stocks of all sectors and a balance described as net lending to overseas. This concept of net lending to overseas includes increases (and, negatively, decreases) in Australia's overseas monetary reserves. The net lending to overseas is also the balance on current transactions in the overseas transactions account.

The **overseas transactions account** records all transactions of a current nature between Australian and overseas residents. Although this is an account for the overseas sector, the items are named from the Australian viewpoint. The account shows that Australia's current receipts from overseas consist of the value of Australia's exports of goods and services, property and labour income received from overseas, unrequited transfers from overseas and extraordinary insurance claims. These receipts are used for Australia's imports of goods and services and payments of property and labour income and unrequited transfers to overseas; the balance of current receipts represents net lending to overseas. Positive net lending to overseas corresponds to a surplus on current transactions with overseas, and negative net lending corresponds to a deficit. The transactions in property income shown in this account differ from estimates shown in balance of payments statistics because, in the national accounts, undistributed company income is not imputed to the beneficial owners. For this reason, net lending to overseas differs from the balance on current account shown in balance of payments statistics.

### **Estimates at constant prices**

In addition to providing an overview of total economic activity, the national accounts provide information on the relationships between different parts of the economy, and also on changes in individual components, and their relationships with each other over time. One of the difficulties involved in interpreting the impact of changes from one period to another is that any observed movement is generally a combination of a change in price and a change in quantity. In many cases, interest lies in the changes in physical quantity underlying the dollar value of transactions. Consequently, the development of series adjusted to remove the effect of price changes is an important extension to a national accounting system. Estimates adjusted in this way are said to be at **constant prices**, whereas national accounting aggregates expressed in terms of the actual dollar values used in transactions are said to be at **current prices**.

An estimate of the change over time in the quantity of an individual commodity produced can be made simply by collecting data on the number of units produced, but the only practicable way in which quantities of diverse goods and services produced (or used) can be aggregated is in terms of money values, such as the value of output or the value of materials used. However, changes in money values may reflect nothing more than changes in the underlying prices. Making estimates at constant (or fixed) prices is the best way of having a common unit of measurement, while avoiding the direct effects of changing prices.

The current price value of a transaction may be expressed conceptually as the product of a price and a quantity. The value of the transaction at constant prices may then be thought of as being derived by substituting, for the current price, the corresponding price in the chosen base year. Aggregates at constant prices for each period are obtained by summing constant price values of the component transactions. In effect, quantities of the commodities involved in the component transactions are combined using their prices in the base year as weights. Constant price estimates are presented in tables for gross domestic product, exports and imports of goods and services, and gross national expenditure and its principal components on page 873.

### Reliability and revisions

Estimates of national income and expenditure are necessarily prepared from a very wide range of statistical information, some of which is available quickly and some of which is available only after a delay of several years. Some of it is closely related to the desired national accounting concepts, but some of it is not completely satisfactory in various respects, including coverage, concepts and timing. Estimates for the most recent years are therefore subject to revision. This applies particularly to estimates based on income tax statistics—income of companies, non-farm unincorporated enterprises, depreciation, and part of private gross fixed capital expenditure—which are subject to substantial revisions for the last couple of years because tabulations of income tax statistics become available progressively one to two years after the end of each financial year.

### National income and expenditure tables

The figures shown in the following tables are consistent with data published in *Budget Related Paper No. 2, National Income and Expenditure, 1986–87* (5213.0) and *Quarterly Estimates of National Income and Expenditure, Australia, June Quarter 1987* (5206.0), except where footnoted otherwise.

(a) Estimates prior to 1969-70 have been derived from estimates valued at the average prices of an earlier base year. A description of the methods used is presented in Appendix C of the 1985-86 edition of *Australian National Accounts: National Income and Expenditure* (5204.0).

## CHAPTER TWENTY-SIX

### FOREIGN TRANSACTIONS

---

This chapter includes statistics of foreign trade, balance of payments, foreign investment by private investors; and foreign ownership and control of enterprises in Australia.

#### AUSTRALIA'S FOREIGN TRADE—AN HISTORICAL SUMMARY

The following tables show Australian trade (including gold) with overseas countries from the earliest date for which reasonably reliable records are available. Some of the problems which arose in compiling the early figures are noted below.

##### **Records of past years**

Before Federation, each State recorded its trade independently and the only available means of ascertaining the total trade of Australia for those years is by aggregating the records of the States. However, the results are subject to error, as the past records of values and direction of trade are not on uniform lines. The figures in the following tables for years prior to Federation have been carefully compiled and may be taken as representative of the overseas trade of Australia as a whole.

##### **Currency**

All values in the following tables are in Australian dollars f.o.b. Values for years prior to 1966 were converted from pounds to Australian dollars at the rate of one pound equals two dollars.

##### **The trade year**

Before 1 July 1914, statistics relating to overseas trade were shown on a calendar year basis. From that date on, the statistics relate to the financial year ending 30 June.

##### **Ships' stores and ships imported and exported**

Prior to 1906, goods loaded in Australian ports on board overseas ships as ships' stores were included in general exports. From 1906 onward, stores were specially recorded as such and omitted from exports. However, ships' stores were again included in total export statistics commencing in July 1982 following a United Nations Statistical Commission recommendation. The imports and exports of ships were not recorded prior to 1905.

##### **Total foreign trade**

Table 1 shows the total trade of Australia with overseas countries. The period 1826 to 1975 has been divided into ten-yearly periods and the figures shown represent the annual averages of the periods specified. Figures for individual years can be found in *Year Book* No. 35 and earlier issues but it should be noted that in those issues imports are shown in British currency. Figures given here for the early years are only approximations of the actual figures.

##### **Imports and exports by commodity groupings**

Tables 2 and 3 show imports and exports by selected commodity groups. Figures are given for selected years at ten-yearly intervals from 1902 to 1982 and for each year thereafter. Commodity data are not available in a viable form before Federation. In July 1965, the Statistical Classification of Imports was replaced by the Australian Import Commodity Classification, so commodity data after that date are not directly comparable with data classified according to the old classification.

## Trade with selected countries

Tables 4 and 5 show the value and percentage of trade with selected overseas countries. Figures for years prior to 1902 are the averages for the periods indicated; subsequent figures are for selected years at ten-yearly intervals up to 1982 and for each year thereafter.

TABLE 1: VALUE OF IMPORTS AND EXPORTS AT CURRENT PRICES (1826-1987)  
AND CONSTANT PRICES (1972-1987)  
(\$ million)

| Year ended<br>30 June— | Total imports     |                        | Total exports     |                            | Excess of exports (+)<br>or imports (-) |                        |
|------------------------|-------------------|------------------------|-------------------|----------------------------|-----------------------------------------|------------------------|

(a) Constant Price Values are based on average 1979-80 prices. (b) Constant Price Value exports for 1983 and later years exclude stores taken on by international vessels. (c) Total imports and exports at current prices exclude non-merchandise trade from the commencement of the year ended 30 June 1977 in this table.

## FOREIGN TRADE

## Constitutional provisions and legislation

## Constitutional provisions

By the Commonwealth of Australia Constitution Act, section 51 (1), the power to make laws with respect to trade and commerce with other countries was conferred on the Australian Parliament. Under section 86 of the Constitution, the collection and control of duties of customs and excise was passed to the Executive Government of the Commonwealth on 1 January 1901. Other references to trade and commerce are contained in sections 87 to 95 of the Constitution.

## Commonwealth Government legislation

Commonwealth Government legislation affecting foreign trade includes the *Customs Act 1901*, the *Customs Tariff Act 1987* and the *Customs Tariff (Anti-Dumping) Act 1975*. The Customs Tariff Act provides the statutory authority for imposing the actual rates of duty operative from time to time, while the Customs Tariff (Anti-Dumping) Act provides protection for Australian industry against various forms of unfair trading.

## The Customs Tariff

The first *Australian Customs Tariff* was introduced by Resolution on 8 October 1901, from which date uniform duties came into effect throughout Australia. The *Australian Customs Tariff* was developed in a period when government industry policy was influenced

by a desire to protect Australian industries from import competition. More recently however, governments have held the view that for Australia to maximise its national income, it must encourage industries which are capable of operating under lower levels of protection. While customs collections are still a major source of revenue, the reliance on tariffs as an industry assistance measure is diminishing, with more emphasis being placed on measures which actively assist industry to improve its efficiency.

On 1 January 1988 Australia introduced a new Tariff based on the Customs Co-operation Council Convention on the Harmonized Commodity Description and Coding System.

The customs value of imported goods is established in accordance with the principles of Article VII of the General Agreement on Tariffs and Trade. This system is given effect by Section 154-Section 161 (D) of the Customs Act. The system provides several methods of valuing goods for Customs purposes as provided in Section 157 (1)-Section 157 (8).

In an unconditional sale, the customs value of imported goods will be based as far as possible on the transaction value method. This method provides for the acceptance of the price actually paid or payable to the vendor, provided sufficient and reliable information is available for this purpose. This price may be subject to adjustments vide Section 154 (2) and Section 159 (3). If there is no price paid or payable, or the price is unacceptable, the other valuation methods must be attempted sequentially.

### Rates of duty

The *Customs Tariff Act 1987* provides for three distinct types of rates. *General rates.* These are set out in Schedule 3 to the Customs Tariff Act and apply to goods from all countries that do not qualify for either Special rates of duty or Concessional rates of duty for a particular tariff classification.

*Special rates:* These are set out in Schedule 3 to the Customs Tariff Act and apply to goods, the produce or manufacture of specified countries being:

- *Forum Island Countries.* These countries are set out in Part I of Schedule 1 to the Customs Tariff Act and preference is given to goods the subject of the South Pacific Regional Trade and Economic Co-operation Agreement (SPARTECA).
- *Developing Countries.* Those countries set out in Part II of Schedule 1.
- *Papua New Guinea.* The rates of duty are set out in Schedule 3 to the Customs Tariff Act and preference is given to goods the subject of the Papua New Guinea/Australia Trade and Commercial Relations Agreement (PATCRA). Wherever PNG is not mentioned in Schedule 3, goods take a FREE rate of duty.
- *New Zealand.* The rates of duty are set out in Schedule 3 to the Customs Tariff Act and preference is given to goods the subject of the Australia/New Zealand Closer Economic Relations—Trade Agreement (ANZCERTA). Where New Zealand is not mentioned in Schedule 3, goods take a FREE rate of duty.
- *Canada.* The rates of duty are set out in Schedule 3 to the Customs Tariff Act and preference is given to goods the subject of the Canada/Australia Trade Agreement (CANATA).

*Concessional rates.* The rates of duty are set out in Schedules 4 and 5 to the Customs Tariff Act:

- Schedule 4, applies to Special Concessional rates of duty and is applicable to imports from all sources complying with particular ownership or other provisions.
- Schedule 5, contains all rates of duty both normal and concessional, for goods subject to tariff quotas.

### Import controls

The effects of the world-wide recession in the early 1970s necessitated the imposition of import controls over particular commodities to protect employment and investment in some important Australian industries. At present, the textile, clothing and footwear, motor vehicle and cheese industries are assisted by tariff quotas, while imports of certain used, secondhand or disposals earthmoving, excavating and materials handling equipment and certain used, secondhand and disposals four-wheel drive vehicles are subject to import licensing controls.

The decision to impose controls either in the form of import licensing or tariff quotas is made by the Commonwealth Government based on the recommendations of the Industries

Assistance Commission after inquiry into the industry. Both forms of control are usually applied on a global basis and are intended to provide short term assistance to an industry but there are significant differences in their application.

Import licensing is a non-tariff form of protection that imposes an absolute restriction on the quantity, weight or value (as appropriate) of the goods that may be imported in a certain period. Goods imported without a licence cannot be entered for home consumption and may be subject to seizure as prohibited imports. The legal basis for import licensing is the Customs (Import Licensing) Regulations prescribed under the Customs Act.

In respect of goods subject to tariff quotas, by-laws are made pursuant to Section 271 of the Customs Act and Determinations are made pursuant to Section 273. These allow goods to be imported and cleared for home consumption at normal rates of customs duty up to a ceiling level specified by the government for a particular period. Additional temporary (or penalty) duties are applied to goods entered for home consumption outside the quota arrangements.

The Customs (Prohibited Imports) Regulations, as prescribed under Section 50 of the Customs Act, list those commodities which are prohibited absolutely, or restricted, on social grounds. Other items are restricted on health grounds (human, animal or plant) by the *Quarantine Act 1908*, the *Therapeutic Goods Act 1966*, and the *Wildlife Protection (Regulation of Exports and Imports) Act 1982*; and sundry allied Commonwealth and State legislation.

### Export controls

Section 112 of the *Customs Act 1901* provides that the Governor-General may, by regulation, prohibit the exportation of goods from Australia and that this power may be exercised by:

- (a) prohibiting the exportation of goods absolutely;
- (b) prohibiting the exportation of goods to a specified place; or
- (c) prohibiting the exportation of goods unless prescribed conditions or restrictions are complied with. Goods subject to this export control are listed in the Customs (Prohibited Exports) Regulations.

Export prohibitions may also be imposed under the Export Control Act administered by the Department of Primary Industries and Energy, the Wildlife Protection (Regulation of Exports and Imports) Act administered by the Department of Arts, Sport, the Environment, Tourism and Territories; the Quarantine Act; and sundry allied Commonwealth and State legislation.

### Exchange control

Up to 25 June 1984, control over goods exported from Australia was maintained under the Banking (Foreign Exchange) Regulations to ensure that the full proceeds from the sale of such goods were received into the Australian banking system. However, as part of the general relaxation of exchange controls announced by the Government and applying from 25 June 1984, controls in respect of export proceeds were removed completely.

### Trade descriptions

*The Commerce (Trade Descriptions) Act 1905*, administered by the Australian Customs Service, gives power to require the application of a proper trade description to certain prescribed goods imported into or exported from Australia. Goods which must bear a prescribed trade description upon importation into Australia are specified in the Commerce (Imports) Regulations. With regards to exports from Australia, marking requirements are prescribed in regulations issued under the Act and in relation to specified export commodities.

### Export integration—EXIT

The Australian Customs Service is developing an electronic communication network (EXIT) to integrate export documentation procedures involving Customs, other government agencies with responsibility for controlling exports, ABS, exporters and freight carriers. The EXIT communication network will streamline the recording and reporting of export cargo.

## Australian Trade Commission

The Australian Trade Commission (Austrade) was formed in January 1986 to provide a wide range of services to exporters. Functions taken over by the new authority were formerly carried out by the Trade Commissioner Service, the Export Development Grants Board, the Export Finance and Insurance Corporation, the Australian Overseas Projects Corporation and the marketing and promotion elements of the Department of Foreign Affairs and Trade.

The objectives of Austrade are to improve export performance by motivating industry to become more export oriented, to facilitate export marketing and to advocate an improved environment for export.

Austrade has offices in all capital cities, Wollongong, Newcastle, Geelong and Townsville. Offices are also located in all major overseas trading countries and in many other countries with representation by Australian Trade Correspondents and Marketing Officers.

### Export finance and insurance

Austrade provides direct loans to overseas borrowers for the purchase of Australian capital goods and services. It also offers guarantees to lending institutions which finance Australian exporters, or who make loans to overseas borrowers.

Insurance services are provided to cover Australian exporters of goods and services against non-payment and against unfair calling of bonds and guarantees. Indemnities are provided to financial institutions or insurers providing bonds or guarantees to overseas buyers. Insurance is also provided to Australian firms against political risks associated with their overseas investments.

### Export incentives

Austrade is an export incentive scheme in the form of cash grants based on eligible expenditure for such overseas activities as market research, fares, representation, advertising and the cost of participating in overseas trade displays.

The Export Market Development Grants Scheme aims to encourage Australian exporters to seek out and develop overseas markets for goods, specified services, industrial property rights and know-how which are substantially of Australian origin. Grants are determined on the basis of 70 per cent of eligible expenditure in excess of \$5,000, and are subject to a maximum of \$200,000 in any one grant year.

As an incentive to new small exporters, Austrade services are provided free of charge and special assistance is provided to high technology exports. In recognition of achievement, Austrade runs an annual program of export awards.

### Overseas projects

Austrade assists Australian businesses to obtain contracts associated with overseas projects. Specialist Trade Commissioners are stationed at strategic global locations to keep Australian businesses informed on developments. They identify project opportunities and provide early warning of project proposals and priorities. Austrade can also undertake a project and finance packaging role for consortia of Australian companies in bidding for overseas projects.

### Overseas services

Through its overseas network, based upon the Trade Commission Service, Austrade is able to channel information on commercial opportunities direct to Australian companies. Trade Commissioner offices employ local staff who are expert in the language and marketing system of the countries in which they are located.

The overseas offices provide advice on commercial opportunities and economic developments and can assist in making representations to governments on such matters as tariffs, quarantine requirements or industrial standards. They can also help to resolve trade disputes.

The Trade Commissioners provide advice on agents, distribution systems and marketing techniques and for a fee can carry out market research or other client specific services.

A brief account of the origins of the Trade Commissioner Service is available in *Year Book No. 51*.

### **Trade displays**

Austrade arranges participation at trade fairs, exhibitions and displays throughout the world. Australian exporters are encouraged to use the displays as an opportunity to make direct sales, obtain new markets, negotiate contracts and gauge market reaction to Australian products and services. Austrade provides space and a co-ordinated stand design and pays half of all direct costs of mounting a display including expenses of design, space rental, construction and publicity.

### **Overseas publicity**

To create an awareness of Australian goods and services in overseas markets, Austrade undertakes advertising and publicity including direct mail and targeted trade media publicity. Special publications in English and other languages are produced. Product information is distributed to leading journals and newspapers in addition to direct advertising.

### **Trade missions and buying visits**

Trade missions for specific industries or groups of firms and survey missions designed to explore prospects in new or developing areas are arranged regularly. Austrade also co-ordinates a program of visits to Australia by overseas buyers.

## **Foreign trade relations**

### **Trade policy**

As a major producer of a wide range of minerals and agricultural commodities, the Australian economy is very dependent on international trade. Australia is a major exporter of coal, iron ore, bauxite, alumina, manganese, nickel, mineral sands, diamonds, uranium, natural gas, wool, meat, wheat, and sugar. Imports of capital equipment form a high proportion of total imports. There is a large market for imported manufactured goods even though Australia has extensive manufacturing industry. Trade in services is heavily imbalanced in favour of the rest of the world.

Australia is dependent on stable international trade markets for commodities, and trade policy objectives include:

- maintaining of an open international trade and payments system
- maintaining of an equitable framework of multilateral rules based on non-discrimination, predictability and transparency which provides for progressive trade liberalisation
- ensuring fair and reasonable access to markets for agricultural products, restraints on subsidised competition in third world markets and stability in commodity markets
- achieving fair and stable prices for minerals and market security
- promoting of employment through increased exports in general and increased exports of manufactures and services in particular.

Further, Australia maintains a substantial involvement in the General Agreement on Tariffs and Trade (GATT), the Organisation for Co-operation and Development (OECD) and the United Nations Conference on Trade and Development (UNCTAD). It also participates in the activities of a number of international bodies responsible for trade in particular commodities.

In relation to trade with particular countries, Australia has representation in all major markets and has bilateral trade agreements with many of the major trading partners. The agreements normally provide for reciprocal favoured nation treatment for imports, close consultation on trade matters and, in many instances, the operation of a joint committee or commission. In some cases the agreements also embrace industrial and technical co-operation and business investment. (Some details of agreements with particular countries are included in the 1986 and earlier issues of the *Year Book*).

### **General Agreement on Tariffs and Trade—GATT**

The GATT is an international treaty which provides a framework for the conduct of world trade. The GATT provides a forum for resolution of trade problems and its objective is to liberalise world trade, leading to general economic growth and development.

The most recently completed round of negotiations under the GATT was the Tokyo Round (1973-79). In summary, the agreements reached included codes of conduct on subsidies and countervailing duties, government procurement, customs valuation, standards, import licensing, anti-dumping and trade in civil aircraft.

Australia, along with other developed country contracting parties to the GATT, has introduced tariff preferences for developing countries under the Generalised System of Preferences (GSP). These preferences are unilateral, non-reciprocal and non-contractual. Accordingly, Australia reserves the right to modify, withdraw, suspend or limit the preferences especially where there is injury to domestic producers. Margins of preference are generally 10 to 15 per cent below the General Tariff rate.

The eight Round of GATT trade negotiations was launched at Punta del Este in Uruguay during 1986. Australia is making a substantial commitment to the success of the Uruguay Round. As well as covering merchandise trade this round will encompass trade in services.

In recent years world trade in many agricultural commodities has been in crisis due to factors largely beyond Australian control. At the beginning of the Uruguay Round, Australia sought a stronger voice by initiating the Cairns Group of Fair Traders in Agriculture. The group comprising fourteen developed and undeveloped countries has common interest in securing a more stable trade environment for agricultural products. The main objectives for Australia in the Uruguay Round are to reduce agricultural subsidies and agricultural market entry restriction, to improve the rules on the use of subsidies and protection, to reduce protection affecting Australian exports, to make the GATT disputes settlement mechanisms more effective and to devise rules to keep services trade policies fair.

### **Organisation for Co-operation and Development—OECD**

In association with other members of the OECD, a communiqué was issued following the Ministerial Council Meeting in May 1987 which adopted principles and actions covering both domestic and international agricultural policy. This reflected many of the points put forward by the Prime Minister in his statement on 'Resolving the World Agricultural Crisis' made earlier at the European Management Forum in February 1987.

### **United Nations Conference on Trade and Development—UNCTAD**

Australia actively participated in UNCTAD to achieve an outcome to its Seventh Session in July 1987 which reinforces the GATT agricultural trade objectives. Australia has advanced specific proposals for UNCTAD work to complement work in the GATT Uruguay Round. In particular, at the 33rd session of the UNCTAD Trade and Development Board and at subsequent meetings, analytical studies were proposed on agricultural protectionism and non-tariff trade barriers.

## **Collection and presentation of statistics**

### **Source of data**

Foreign trade statistics are compiled by the Australian Bureau of Statistics from documentation submitted by exporters and importers or their agents to the Australian Customs Service as required by the Customs Act.

### **Scope of the statistics**

The statistics presented below are, with one exception, recorded on a *general trade* basis, i.e., total exports include both Australian produce and re-exports, and total imports comprise goods entered directly for home consumption together with goods imported into bonded warehouses. The statistics of import clearances, however, are recorded on a *special trade* basis, i.e., clearances comprise goods entered directly for home consumption together with goods cleared into the home market from bonded warehouses. Exports of Australian produce are goods, materials or articles which have been produced, manufactured or partly manufactured in Australia, except goods which were originally imported and have undergone only repair or minor operations which leave them essentially unchanged. Re-exports are goods,

materials or articles originally imported which are exported either in the same condition in which they were imported or after undergoing repair or minor operations which leave them essentially unchanged. Minor operations include blending, packaging, bottling, cleaning, sorting, husking or shelling. Total exports are the aggregate of exports of Australian produce and re-exports.

The following are excluded from recorded trade statistics:

- (a) direct transit trade, i.e., goods being trans-shipped or moved through Australia for purposes of transport only;
  - (b) migrants' and passengers' effects exported or imported; and parcel post exports and imports of small value, for which Customs entries are not required;
  - (c) certain materials under inter-governmental agreements for defence and similar projects for which Customs entries are not required;
  - (d) ships and aircraft engaged in the transport of passengers or goods between Australia and other countries;
  - (e) the sale or purchase of any ship and/or aircraft intended for use on overseas routes;
  - (f) fish and other sea products landed in Australia or abroad directly from the high seas by Australian ships;
  - (g) export consignments where the value of the goods in each transaction is less than \$500.
  - (h) entries lodged on informal clearance documents (ICD) for values not exceeding \$500. In addition, from 21 October 1985 onwards, ICD's for postal articles valued between \$250 and \$1,000 are excluded;
- and for imports only;
- (i) bunkers and stores supplied to ships and aircraft prior to arrival in Australia.

## Statistical period

### Exports

Exports are recorded statistically in the month the entries are lodged with the Australian Customs Service. Regular exporters or their agents may provide details of their export shipments on a periodic rather than an individual shipment basis by submitting weekly or monthly returns. These 'periodic returns' must be submitted to the Australian Customs Service within seven days of the end of the period in question covering all shipments during that period. All other exporters are required to report each individual shipment prior to the ship's departure. Approximately 90 per cent of monthly export values are recorded on periodic returns. The statistical month for Customs outports (generally ports other than those at which the main Customs Office in each State is located) closes on the twenty-first of each month, whereas for mainports the statistical month is the calendar month. Because of these factors, export statistics for a particular month do not necessarily represent all of the commodities actually exported during that month. Analysis of past data has shown that in aggregate approximately 40 per cent of export trade by value for a particular month reflects actual shipments during that month, 55 per cent by value was actually exported during the previous month with the remaining 5 per cent by value exported in earlier months. For individual commodities the percentage by value representing actual exports in a month may vary considerably.

### Imports

Imports are recorded statistically in the calendar month in which the import entries were both finalised by the Australian Customs Service and passed to the Australian Bureau of Statistics for further processing. Import entries may be lodged early using the check-to-arrive system or the documents may be delayed because of various validation checks carried out by Customs prior to the entries being passed to the Bureau. Import statistics for a particular month do not necessarily represent entries lodged or commodities actually imported during the month in question. Analysis of past data has shown that in aggregate approximately 70 per cent of import trade by value recorded for a particular month was actually imported during that month, 25 per cent was actually imported during the previous month with the remaining 5 per cent being imported in earlier months. For individual commodities the percentage by value representing actual imports in a month may vary considerably.

## State

For exports, State statistics comprise the State of origin for Australian produce. State of origin is defined as the State in which the final stage of production or manufacture occurs.

For imports, the State is that in which the import entry was lodged with the Australian Customs Service. The port of lodgement of the import entry is not necessarily the port of discharge of the goods. Goods forwarded interstate after import, whether in containers or not, are recorded as being imported at the port of lodgement of the import entry.

## Valuation

### Exports

Goods actually sold to overseas buyers prior to shipment are valued at the free-on-board (f.o.b.) Australian port of shipment equivalent of the actual price at which the goods were sold. Goods shipped on consignment are valued at the f.o.b. Australian port of shipment equivalent of the current price offering for similar goods of Australian origin in the principal markets of the country to which the goods are dispatched for sale. The recorded value of exports includes the value of the outside package, other than international containers used for containerised cargo.

### Imports

The recorded value of imports is the customs value (formerly referred to as the value for duty). On 30 November 1981, Australia changed its system of valuation from the Brussels Definition of Value (BDV) to the GATT Agreement on Customs Valuation. The Agreement reflects one of a number of trade related codes of conduct established during the round of Multi-lateral Trade Negotiations (MTN) concluded in 1979. The GATT Agreement differs from the Brussels Definition of Value in that it offers a set of practical rules on the valuation of imports rather than a list of conceptual guidelines. Under the Agreement the primary basis for establishing the customs value is the price actually paid or payable, provided a number of conditions are met. The most important condition is that the buyer and seller must be independent of each other. If the conditions are not met, the practical rules are used to determine the customs value. The recording of the value of imports remains on a free-on-board (f.o.b.) basis (i.e. the charges and expenses involved in delivering the goods from the place of exportation to Australia are excluded). The recorded value also continues to include the value of outside packages, other than international containers used for containerised cargo. For details of the method of valuation used prior to 30 November 1981, see *Year Book* No. 66.

## Merchandise exports and imports

In accordance with standards recommended by the United Nations:

*Merchandise exports* are defined as all goods which subtract from the stock of material resources in Australia as a result of their movement out of the country. Merchandise exports, therefore, exclude goods exported with the reasonable expectation of re-import within a limited time. A complete list of commodities not included in merchandise trade is shown under section 9 (b) of the *Australian Export Commodity Classification* (AECC) (1203.0). These include, for example, coin being legal tender and goods for temporary exhibition outside Australia.

*Merchandise imports* are defined as all goods which add to the stock of material resources in Australia as a result of their movement into the country. Merchandise imports, therefore, exclude goods imported with the reasonable expectation of re-export within a limited time. A complete list of commodities not included in merchandise trade is shown under section 9 (b) of the *Australian Import Commodity Classification* (AICC) (1204.0). These include, for example, coin being legal tender and goods for temporary exhibition in Australia.

From July 1985, non-merchandise trade is excluded from Australia's export and import statistics. This is in accordance with United Nations' recommendations and practices adopted by Australia's major trading partners. Statistics for periods prior to July 1985 included in this publication have been adjusted to be comparable with data from July 1985 onwards and, consequently, will not be directly comparable with previous publications.

## Commodity classification

Exports and imports are classified according to the items of AECC and AICC respectively which, from 1 July 1978, have been based on the *Standard International Trade Classification*, Revision 2 (United Nations Statistical Papers, Series M, No. 34, Revision 2, 1975). Copies of, or extracts from these classifications may be obtained from offices of the ABS.

## Australian Standard Commodity Classification—ASCC

ASCC has been developed by the ABS to enable users to compare statistics of commodities produced in Australia with statistics of commodities imported and exported.

The ASCC manual (1207.0 and 1208.0) links production, import and export items at their most detailed level of comparability in the form of standard (ASCC) commodity items. In a large number of cases, however, due to the differences between production, import and export items, comparability is only achieved at fairly broad aggregate levels. In ASCC, commodities are grouped under industries (as defined in the *Australian Standard Industrial Classification* ASIC) in which they are typically produced. (See Chapter 18, Manufacturing and Internal Trade).

## ASIC industry of origin

Export and Import statistics are classified according to subdivisions of ASIC. The statistics are compiled by allocating statistical items of AECC and AICC to the ASIC industry of origin with whose main economic activities the commodities are primarily associated. A full description of ASIC classes is contained in the publication *Australian Standard Industrial Classification*, Vol. 1—*The Classification* (1201.0).

## Broad economic categories

Exports and Imports of merchandise are classified according to the nineteen categories of the United Nations classification, Broad Economic Categories (BEC). BEC attempts to classify foreign trade statistics for the purposes of general economic analysis according to the main end use of the commodities traded.

## Harmonized commodity description and coding system

From 1 January 1988, detailed import and export statistics have been reported solely according to the Harmonized Tariff and the Australian Harmonized Export Commodity Classification respectively. Statistical output is now based on the *Standard International Trade Classification* (SITC) *Revision 3*, which is closely aligned with the Harmonized commodity classifications. SITC Rev 3 based import and export data will be shown in the 1989 and ensuing *Year Books*.

## Country

For the purposes of foreign trade statistics, a country is defined as a geographical entity which trades, or has the potential to trade, with Australia in accordance with Australian Customs provisions. *External territories under Australian administration are treated separately* while self-governing territories and dependant territories under the administration of other countries *may* be treated as individual countries in Australian foreign trade statistics.

*Exports:* for exports, *country* refers to the country to which the goods were consigned at the time of export. Where it was found to be impossible to determine the destination, goods are recorded as *Destination unknown*.

*Imports:* for imports, *country* refers to the country of origin of the goods which is defined as the country of production for customs purposes. Where it is found to be impossible to determine the origin, goods are recorded as *Origin unknown*.

### Quantity data

Where quantities are shown they are generally expressed in terms of the normal unit of quantity used in the appropriate industry and as specified in AECC and AICC published by the ABS. Quantities are not tabulated in respect of statistical items for which there is no appropriate unit of quantity (e.g. a statistical item which covers a number of commodities that cannot be recorded under a single unit of quantity).

### Excess of exports or imports

The excess of the value of exports or imports does not represent the balance of trade. The balance of trade is the excess of exports or imports on a *balance of payments* basis. Details of the adjustments (relating to coverage, timing and valuation) made to total recorded exports and imports for balance of payments purposes, are set out in the annual publication *Balance of Payments, Australia* (5303.0).

### Treatment of confidential data

To ensure that information about the activities of particular businesses is not disclosed, it is necessary to restrict the release of statistics of certain commodities. These restrictions do not affect total export or import figures but they can affect statistics at all levels of the Australian Export and Import Commodity Classifications.

## Foreign trade statistics

### Total foreign trade

The following table shows the total Australian trade with foreign countries from 1981-82 to 1986-87.

FOREIGN TRADE  
(\$ million)

| Year        | Exports | Imports | Excess of exports (+) or imports (-) |
|-------------|---------|---------|--------------------------------------|
| 1981-82     | 19,294  | 22,767  | -3,473                               |
| 1982-83     | 21,454  | 21,216  | +238                                 |
| 1983-84     | 24,013  | 23,540  | +473                                 |
| 1984-85     | 29,708  | 29,049  | +659                                 |
| 1985-86     | 32,818  | 34,691  | -1,873                               |
| 1986-87 (p) | 35,725  | 37,092  | -1,367                               |

The following table shows particulars of non-merchandise trade for recent years.

NON-MERCHANDISE TRADE  
(\$ million)

| Year        | Exports | Imports |
|-------------|---------|---------|
| 1981-82     | 281     | 238     |
| 1982-83     | 668     | 590     |
| 1983-84     | 753     | 521     |
| 1984-85     | 834     | 971     |
| 1985-86     | 1,418   | 1,045   |
| 1986-87 (p) | 1,384   | 1,042   |

The following diagrams show the foreign trade of Australia, 1976-77 to 1986-87 and the value of exports and imports, proportions by country, 1981-82 to 1986-87.

### Classified summary of Australian foreign trade

The following table shows exports and imports according to divisions of the Australian Export and Import Commodity Classifications (based on the *Standard International Trade Classification* Revision 2).

## Classified summary of Australian foreign trade

The following table shows exports and imports according to divisions of the Australian Export and Import Commodity Classifications (based on the *Standard International Trade Classification Revision 2*).

### EXPORTS AND IMPORTS: DIVISIONS OF THE AUSTRALIAN EXPORT AND IMPORT COMMODITY CLASSIFICATIONS (\$'000)

| Division No. | Description                                                                                   | Exports      |              |              | Imports      |              |              |
|--------------|-----------------------------------------------------------------------------------------------|--------------|--------------|--------------|--------------|--------------|--------------|
|              |                                                                                               | 1984-85      | 1985-86      | 1986-87(p)   | 1984-85      | 1985-86      | 1986-87(p)   |
| 00           | Live animals                                                                                  | 247,652      | 279,546      | 309,258      | 39,782       | 81,892       | 112,824      |
| 01           | Meat and meat preparations                                                                    | 1,373,866    | 1,700,615    | 2,251,400    | 20,163       | 16,674       | 16,334       |
| 02           | Dairy products and birds' eggs                                                                | 420,332      | 437,031      | 467,757      | 68,944       | 78,344       | 80,958       |
| 03           | Fish, crustaceans and molluscs, and preparations thereof                                      | 402,872      | 486,835      | 598,390      | 304,109      | 333,381      | 422,825      |
| 04           | Cereals and cereal preparations                                                               | 4,023,955    | (a)3,940,231 | (a)2,775,788 | 60,395       | 68,528       | 72,898       |

(a) For imports: State in which entry was lodged. The State of lodgement is not necessarily the State in which the goods were discharged or consumed. For exports: State is State of origin of Australian produce and State of final shipment of re-exported goods. State of origin is defined as the State in which the final stage of production or manufacture occurs. Because of this change in the basis on which statistics by State are derived, figures from 1 July 1978 are not directly comparable with those for previous periods. (b) Total excludes non-merchandise trade.

### Import clearances, dutiable clearances, and customs duties collected

The following table shows the value of total import clearances, total dutiable clearances, and the customs duties collected, together with the ratio of total dutiable clearances to total clearances.

## TOTAL IMPORT CLEARANCES, DUTIABLE CLEARANCES, AND DUTIES

|                                                            |          | 1984-85    | 1985-86    | 1986-87(p) |
|------------------------------------------------------------|----------|------------|------------|------------|
| Total import clearances . . . . .                          | \$'000   | 29,907,018 | 35,376,584 | 38,021,386 |
| Total dutiable clearances . . . . .                        | "        | 18,551,873 | 21,901,431 | 23,573,259 |
| Total customs duties collected . . . . .                   | "        | 2,979,888  | 3,388,711  | 3,289,505  |
| Ratio of dutiable clearances to total clearance            | per cent | 62.0       | 61.9       | 62.0       |
| Ratio of duties collected to dutiable clearances . . . . . | "        | 16.1       | 15.5       | 14.0       |

## Excise

Although excise goods have no immediate bearing on foreign trade, the rate of excise duty is in some cases related to the import duty on similar goods. Moreover, as the Excise Acts are administered by the Australian Customs Service, it is convenient to publish here the quantities of Australian produce on which excise duty has been paid. Particulars of customs and excise revenue are shown in Chapter 24, Public Finance. The following table shows the quantities of goods on which excise duty was paid in Australia.

## QUANTITIES OF PRINCIPAL EXCISABLE GOODS ON WHICH EXCISE DUTY WAS PAID: AUSTRALIA

| Article                                                                     | 1984-85                     | 1985-86                     | 1986-87 (p)                 |

(a) Includes supplies to Commonwealth Government on which excise was paid. (b) Includes automotive, industrial and marine diesel fuel.

## FOREIGN INVESTMENT

Foreign investment statistics provide information on the *level* (stock) of Australia's foreign financial assets and liabilities at a given point in time, *capital transactions* (investment flows) which increase and decrease these assets and liabilities, *other changes* in the value of these assets and liabilities; and *income* receivable and payable on these assets and liabilities.

These statistics form an integral part of Australia's balance of payments as well as being useful in their own right in determining, for example, the impact of foreign investment policies and the level of Australia's foreign assets and liabilities, including foreign debt. The statistics are collected from surveys of foreign investment which have been conducted since 1947-48.

### Classification

The primary classification used in foreign investment statistics is the direction of investment. This classification refers to the basic distinction between inward and outward investment; that is, foreign investment in Australia or Australian investment abroad. Broadly, *foreign investment in Australia* refers to the stock of financial assets in Australia owned by foreign residents and capital transactions which increase or decrease this stock. Conversely, *Australian investment abroad* refers to the stock of financial assets abroad owned by Australian residents and capital transactions which increase or decrease this stock.

Foreign investment is undertaken by means of *instruments of investment*. Many types of instrument of investment can be identified, but for analytical reasons and ease of reporting similar instruments are combined.

- *Corporate equities* includes ordinary and preference shares and units in trusts.
- *Borrowing* (foreign investment in Australia) or *lending* (Australian investment abroad) comprises deposits, loans, finance leases, bonds, bills, IMF credit and Bank of International Settlements placements.
- *Reserve Assets* includes monetary gold, Special Drawing Rights and reserve position in the IMF and foreign exchange held by the Reserve Bank of Australia.
- *Other investments* consists of net equity in branches and amounts outstanding in respect of goods, services, interest, dividends etc.
- Finally, *reinvestment of earnings* of direct investors refers to income retained from after tax profits attributable to direct investors.

Statistics are provided in respect of both Australia's *gross foreign debt* (borrowing) and Australia's *net foreign debt*, the latter being derived by deducting reserve assets and lending abroad from gross foreign debt.

The *country* dissection of statistics on foreign investment shows the countries investing in Australia or receiving investment from Australia. The classification is based upon the country of residence of the foreign creditor or debtor holding Australia's financial liabilities or financial assets. It does not necessarily reflect either the country of ultimate beneficial ownership of the investment, the country of immediate source of funds or the country to which amounts borrowed will in fact be repaid.

The *industry* classification used in foreign investment statistics is based upon the *Australian Standard Industry Classification* (ASIC), 1983 edition. For both foreign investment in Australia and Australian investment abroad, investment is classified by the industry of the enterprise group receiving that investment. Industry statistics should be treated with some caution as they do not necessarily reflect the industry in which the funds are ultimately employed.

### Coverage

As there is no comprehensive source for identifying enterprises engaged in foreign investment activity, lists of enterprises included in foreign investment surveys are compiled from a variety of sources. These sources include stock exchange reports, company reports, newspapers and the financial press, business directories, tax declaration forms submitted under the Banking (Foreign Exchange) Regulations, information provided on a confidential basis of proposals approved by Foreign Investment Review Board and records of the Commissioner of Corporate Affairs in some States.

## Valuation and timing

Market price is the principle method of valuation in foreign investment statistics. Capital transactions are recorded on a change of ownership basis, that is, at the time when the foreign financial assets or liability is acquired, sold, repaid or otherwise disposed of. By convention, this is taken to be the time at which the event is recorded in the books of the transactors. Investment income is generally recorded at the time it becomes due for payment.

## Foreign investment statistics

The table below shows a reconciliation between opening and closing levels of foreign investment in Australia, Australian investment abroad and Australia's net international investment position. The table also shows income payable on foreign investment in Australia, income receivable on Australian investment abroad and net income payable.

**FOREIGN INVESTMENT SUMMARY TABLE**  
(SA million)

(a) For foreign investment in Australia, income payable is calculated before the deduction of withholding tax. For Australian investment abroad, up to and including 1984-85, income receivable is calculated after deducting withholding tax; from 1985-86 withholding tax is not deducted. (b) Details of exchange rate variations are not separately available for a number of items and have consequently been included in 'other changes'. For foreign investment in Australia these items include accounts payable to unrelated foreign enterprises abroad (a component of 'other investment'). For Australian investment abroad, before 1985-86, exchange rate details are only available for bank lending and reserve assets. From 1985-86 exchange rate details are available for all items except accounts receivable from unrelated foreign enterprises abroad (a component of 'other investment'). (c) From 1984-85, figures for official reserve assets are not fully comparable with earlier data due to changes in the Reserve Bank's accounting procedures. (d) Net international investment position equals foreign investment in Australia less Australian investment abroad. (e) Foreign borrowing by Australian residents less the sum of reserve assets and Australian lending abroad.

The following table provides details on Australia's foreign debt, including foreign borrowing, reserve assets and lending abroad and net foreign debt.

(a) The industry categories shown are based on the 1983 edition of ASIC and relate to the predominant activity of the enterprise group receiving the investment funds. This is not necessarily the industry of the end use of the funds. (b) Includes the Reserve Bank and the State Government part of General Government. (c) Includes the Commonwealth Government part of General Government. (d) Consists of: Division H—Communications, Division K—Community services, and Division L—Recreation, personal and other services. (e) Details of accounts payable/prepayments received are not classified by industry and are therefore included in 'Unallocated'.

## BALANCE OF PAYMENTS

Broadly speaking, the Australian balance of payments is a statistical statement designed to provide a systematic record of Australia's economic transactions with the rest of the world. It may be described as a system of consolidated accounts in which the accounting entity is the Australian economy and the entries refer to all economic transactions between residents of Australia and residents of the rest of the world (non-residents). Such a record is essential for the examination of influences which external factors have on the domestic economy. Balance of payments estimates have always assumed a particular importance in Australia due to the importance of these influences on the Australian economy.

Official estimates of Australia's balance of payments for the period 1928-29 were included in *Year Book* No. 24. Except for the War years 1939 to 1945, estimates have since been published at least annually.

Detailed estimates and brief descriptions of the various items included are provided in the annual publication *Balance of Payments, Australia* (5303.0) while comprehensive regional

data is available in the annual microfiche publication *Balance of Payments, Australia—Regional Series on Microfiche* (5338.0). More timely estimates are provided in the quarterly publications *Balance of Payments, Australia* (5302.0) and *Balance of Payments, Australia—Historical Series on Microfiche* (5337.0), available approximately eight and ten weeks respectively after the end of each quarter. A monthly publication *Balance of Payments, Australia* (5301.0), showing preliminary estimates in less detail, is published about eleven working days after the end of each month. An ABS information paper, *Changes in the Presentation of Australian Balance of Payments Statistics* (5340.0), provides the basis for the current presentation of Australian balance of payments statistics and contains useful information on the classification and coverage of balance of payments transactions. Changes which have occurred since its publication on 23 December 1985 are described in 5303.0 for 1985–86.

Balance of payments statements cover a wide range of economic transactions which may be broadly divided into three categories. The first category comprises transactions in goods, services and income between residents of Australia and non-residents. The second category relates to financial transactions involving claims on and liabilities to the rest of the world. Because the statement is constructed on a double entry recording basis, a third category described as unrequited transfers is required to provide offsetting entries for one sided balance of payments transactions, such as gifts in cash and kind which have no 'quid pro quo'. Two changes not arising from transactions—specifically changes in Australia's official reserve assets arising from the allocation (or cancellation) of Special Drawing Rights (SDRs) by the International Monetary Fund (IMF) and the monetisation (or demonetisation) of gold—are included by convention, to make the accounts more analytically useful. The first and third of the above categories are combined in what is described as the current account and the second category together with the two changes not arising from transactions are shown separately in what is described as the capital account.

(a) SDRs, and Australia's reserve position in the IMF are based on the IMF basket valuation for the SDR, which is published in terms of US dollars crossed with the representative rate for the Australian dollar in terms of the US dollar. Gold is valued at the average London gold price for the month, converted to Australian dollars at the market rate of exchange applying on the last trading day of the month. The foreign currency value of all other overseas assets has been based, where applicable, on market quotations. Accrued interest is normally taken into account. Conversion to Australian dollar equivalent is based on end of period market rates of exchange. (b) Derived by averaging exchange rates for trading days.

Under the internationally accepted conventions of the double entry system, credit entries, which have no arithmetic sign, are used to record exports of goods and services, income receivable and financial transactions involving either a reduction in the country's foreign

financial assets or an increase in its foreign liabilities. Conversely, debit entries, identified by a minus sign (—), are used to record imports of goods and services, income payable and financial transactions involving either an increase in foreign financial assets or a decrease in foreign liabilities. Transactions in a double entry accounting system are reflected in pairs of equal credit and debit entries. For example, an export transaction for which payment is received through the banking system involves a credit entry for the export and a debit entry for the increase in foreign exchange assets. Similarly, the repayment of a foreign loan through the banking system involves a debit entry for a reduction in foreign liabilities and a credit entry for the decrease in foreign exchange assets. Any entries that are not automatically paired are matched by special offsetting entries. Such offsetting entries are required in the category of unrequited transfers for one sided balance of payments transactions. Offsets are also required for the other changes not arising from transactions referred to in the previous paragraph.

It follows that, in principle, the net sum of all credit and debit entries is zero. In practice, some transactions are not measured accurately (errors), while others are not measured at all (omissions). Equality between the sum of the credit and debit entries is brought about by the inclusion of a balancing item which reflects net errors and omissions. The balancing item is shown separately outside both current and capital accounts since it reflects the net effects of errors and omissions in both accounts.

In principle, transactions and other changes should be valued in the balance of payments at market prices. However, in practice, transactions are generally valued in the statistics at transactions prices because this basis provides the closest practical approximation to the market price principle. The transactions price is the price at which a transaction is recorded in the accounts of the transactors.

Transactions and other changes recorded in the balance of payments should, in principle, be recorded at the time of change of ownership (either actual or imputed). For the current account this is conceived as the time when ownership of goods changes, services are rendered, when undistributed income of direct investment enterprises is earned, and when interest and dividends become due for payment. In the case of unrequited transfers, those which are imposed by one party on another, such as taxes and fines, should ideally be recorded at the time they become due for payment without penalty; whereas others should be recorded when the goods, services, etc. to which they are offsets change ownership. For capital account transactions the time of change of ownership is, by convention, normally taken to be the time at which transactions are entered in the books of the transactors. Entries for loan drawings should be based on actual disbursements and not on commitments or authorisations. Entries for loan repayments should be recorded at the time they become due rather than on the actual payment date.

In practice, the nature of the available data sources is such that the time of recording of transactions will often differ from the time of change of ownership. This is particularly true in the case of transactions in goods which are, in the main, recorded at the time that administrative records relating to the movement of the goods across the customs frontier are processed. Where practical, timing adjustments are made for transactions in certain goods to ensure that they are recorded in the time period in which change of ownership occurs.

In the tables that follow, global estimates of the current and capital accounts of the Australian balance of payments are presented. The current account table shows entries on a gross basis, i.e. credit and debit entries for each item are shown separately. In contrast, the capital account table is recorded on a net basis. This means credit and debit entries for each item are combined to arrive at a single net result (either a credit or debit).

The current account records transactions between Australian residents and non-residents in merchandise, other goods and services, income and unrequited transfers. In principle, the items included in merchandise should include all movable goods, with a few exceptions, the ownership of which changes from residents to non-residents (exports) and from non-residents to residents (imports). Services covers services rendered by Australian residents to non-residents (credits) and by non-residents to residents (debits), together with transactions in a few types of goods (e.g. goods purchased by travellers). Income covers income earned by Australian residents from non-residents (credits) or by non-residents from residents (debits).

It includes investment income (e.g. dividends and interest), other property income (e.g. royalties) and labour income (e.g. wages and salaries). Unrequited transfers covers the offsetting entries required by the double-entry system of accounting when resources (goods, services and financial assets) are provided, without something of economic value being received in return, by non-residents to Australian residents (offsetting credits required) and by residents to non-residents (offsetting debits required). It includes foreign aid, migrants' transfers, gifts, donations, pensions and taxes.

The capital account records transactions in Australia's foreign financial assets and liabilities, including the creation and extinction of claims on or by the rest of the world and a few specified other changes. Capital transactions are grouped into two broad institutional sectors named official and non-official, with the former split into general government and Reserve Bank. The general government sector comprises transactions of the Commonwealth, the States, local government authorities, and statutory bodies, but it excludes the transactions of public business enterprises. The Reserve Bank sector covers transactions attributed to the central bank. The non-official sector covers transactions of all other resident entities including private and government-owned banks, private and public business enterprises, and households.

**VALUES OF EXPORTS AND IMPORTS OF GOODS AND SERVICES**  
(**BALANCE OF PAYMENTS BASIS**) AT CONSTANT PRICES

The following tables show annual values of Australian exports and imports of goods and services at current and constant (average 1979-80) prices. These estimates are compiled on a balance of payments basis within the framework of the Australian Export Commodity Classification (AECC) and the Australian Import Commodity Classification (AICC). Quarterly figures in original and seasonally adjusted terms are published regularly in the publication *Balance of Payments, Australia* (5302.0).

The current price value of a transaction may be expressed conceptually as the product of a price and a quantity. The value of the transaction at constant prices may then be thought of as being derived by substituting, for the current price, the corresponding price in the

chosen base year. There are, however, many transactions recorded in statistics of overseas trade for which it is not possible to apply such an approach. In such cases it is necessary to make assumptions and approximations (e.g. revaluing by means of the price index which is considered to be most closely related to the commodity involved). The published estimates at constant prices should be viewed in this light.

Estimates at current prices are often divided by their corresponding estimates at constant prices to give measures of price change, which are generally referred to as implicit price deflators (IPDs). IPDs are derived measures and are not normally the direct price measures by which current price estimates are converted to estimates at constant prices. A more detailed discussion of the nature of IPDs is presented in Appendix B of the publication *Australian National Accounts: Concepts, Sources and Methods* (5216.0)

### Merchandise (Balance of Payments basis)

The published components of merchandise exports and imports of goods f.o.b. consist of varying numbers of AECC and AICC divisions and/or sections as shown below.

| <i>Exports</i>                        | <i>Section or<br/>division of<br/>AECC</i>                               | <i>Imports</i>                    | <i>Section or<br/>division of<br/>AICC</i> |

### Services

*Services* covers services rendered by Australian residents to non-residents (credits) and by non-residents to residents (debits), together with transactions in a few types of goods (eg goods purchased by travellers).

### Exogenous and endogenous imports

*Exogenous imports* comprise a group of imported goods which it has been found useful to identify separately in economic analysis because the transactions in these goods are lumpy, subject to government arrangements or significantly affected by factors other than the general level of economic activity in Australia. Exogenous imports include fuels; ships, aircraft and certain other large items of equipment acquired by selected public and private sector trading enterprises; defence goods and certain other government goods.

*Endogenous imports* comprise imports of all goods other than those regarded as exogenous.

Endogenous imports are classified into three classes—*consumption goods*, *capital goods* and *other goods*—according to the United Nations' classification by broad economic categories (BEC). *Other goods* covers the BEC class *intermediate goods* and the residual BEC category *goods not elsewhere specified*. The *classes* consist of the following BEC categories (excluding goods defined as exogenous) shown below.

*Consumption goods—*

Food and beverages, primary, mainly for household consumption (112)  
 Food and beverages, processed, mainly for household consumption (122)  
 Passenger motor vehicles (51)  
 Transport equipment, non-industrial (522)  
 Consumer goods, not elsewhere specified (6)

*Capital goods—*

Capital goods (except transport equipment) (41)  
 Transport equipment, industrial (521)

*Other goods—*

Food and beverages, primary, mainly for industry (111)  
 Food and beverages, processed, mainly for industry (121)  
 Industrial supplies not elsewhere specified (2)  
 Parts and accessories of capital goods (except transport equipment) (42)  
 Parts and accessories of transport equipment (53)  
 Goods not elsewhere specified (7)

## FOREIGN PARTICIPATION STATISTICS

Foreign participation statistics include statistics on both foreign ownership and control of enterprises in Australia. Foreign ownership statistics provide a measure of the beneficial equity interest held by foreign residents (individuals and companies) in enterprises in Australia. Foreign control statistics provide a measure of the potential control, through ownership of voting shares, that foreign residents may have over the key policy decisions of enterprises in Australia. Following the termination of a previous program of studies in 1978, a program of foreign participation studies of industries and economic activities was re-introduced in 1982.

Brief explanatory notes and separate summary tables of ownership and control statistics are presented in the following tables for the most recent studies undertaken in the current program.

For agriculture, separate measures are provided for ownership of agricultural land and for ownership and control of agricultural activity. The statistics presented on foreign ownership of agricultural land are based on the ownership characteristics of the landowners. The

statistics on foreign ownership and control of agricultural activity, on the other hand, are based on the ownership characteristics of the businesses operating on agricultural land. The owners of any particular parcel of land and the business operating on that land can, of course, be different entities.

### Scope and methodology

The scope of each study together with the methodology used is outlined in the individual foreign participation publications listed in the bibliography at the end of this chapter. The statistical unit used in the compilation of the statistics is also defined in each publication. Generally, foreign participation characteristics for statistical units in each study were derived from information on ownership links collected from enterprises included in the biennial ABS Survey of Shareholdings.

### Measurement of ownership and control

*Foreign ownership* is measured in terms of the beneficial equity interest (through ownership links) of all identified foreign residents:

- (i) in enterprises operating in Australia, or
- (ii) in agricultural land.

In order to calculate the beneficial equity interests of foreign residents whose interests are held through other enterprises in Australia, all relevant ownership links are multiplied together. *Australian ownership* is all ownership not identified as foreign ownership.

To measure the aggregate levels of foreign and Australian ownership in a particular industry, the amount reported for the selected data item (such as value added, premiums received, assets, gross value of agricultural commodities produced or area of agricultural land) for each statistical unit is apportioned between foreign and Australian ownership in proportion to percentages of foreign and Australian ownership in that unit. Data for each unit are then aggregated to obtain totals of foreign and Australian ownership.

In *control statistics*, enterprises are classified to one of four categories of control: foreign control; joint foreign and Australian control; naturalised or naturalising; and Australian control.

An enterprise is classified to *foreign control* if it has not been granted naturalised or naturalising status under the government's foreign investment policy and if a foreign investor (individual, company or group of related companies) or a foreign controlled enterprise holds at least 25 per cent of its voting shares and there are no equal or larger shareholdings by an Australian resident, an Australian controlled enterprise or a joint foreign and Australian controlled enterprise. Enterprises in which there are no dominant investors holding at least 25 per cent of the voting shares but all the voting shares are held by foreign residents are also classified to *foreign control*.

An enterprise is classified to *joint foreign and Australian control* if it does not have naturalised or naturalising status and either the single largest shareholder has 25 per cent or more of the voting shares and is itself joint foreign and Australian controlled or there are two or more equally large investors (there being no single larger investor) each with 25 per cent or more of the voting shares in the enterprise and:

- (i) at least one of these investors is either a foreign resident or foreign controlled enterprise and at least one of these investors is either an Australian resident individual or an Australian controlled enterprise; or
- (ii) at least one of these investors is joint foreign and Australian controlled.

An enterprise is classified to *naturalised or naturalising* if it had such status (at the reference period pertinent to each study) under the government's foreign investment policy and would otherwise be classified to either foreign control or joint foreign and Australian control.

All enterprises not classified to foreign control, joint foreign and Australian control, or naturalised or naturalising are classified to *Australian control*.

To measure the levels of control in an industry (or economic activity) for each of these four categories of control, the whole of the amount reported for the selected data item (such

## OWNERSHIP SUMMARY BY COUNTRY OF OWNERSHIP

| Industry/activity                    | Reference period | Ownership measured in terms of:                  | Total value of measure used | Foreign ownership |      |                 |       |            | Australian ownership | Total |

(a) Belgium, Denmark, France, Federal Republic of Germany, Greece, Ireland, Italy, Luxembourg and Netherlands.

(b) Only one enterprise in this category was identified. It has been included in the statistics for the foreign control category.

as value added, type of expenditure, premiums received, assets, gross value of agricultural commodities produced or value of imports) for each statistical unit is allocated to the control category of that unit. Data for each unit are then aggregated to obtain totals for the industry (economic activity) attributable to each of the four control categories.

### Country of ownership and control

In the previous two tables the classifications by country of foreign ownership or control are based on the country of domicile of the immediate foreign investor which may not be the country of domicile of the ultimate foreign investor.

#### **Other Information**

*Special returns service:* Subscribers to this service can receive foreign trade statistics at a particular commodity level on computer produced printout or via the electronic mail service TELESTATS. These statistics are available in one or more of a limited number of formats, for a charge consistent with the level of detail required. This service is recommended where up to fifty specific commodity items are required on a regular basis. More details concerning the special returns service are contained in the information paper *Foreign Trade Statistics: Special Returns Service* (5480.0).

*Microfiche service:* Foreign trade statistics are also available on microfiche in a variety of tabular formats. Each tabular format covers all commodities exported or imported at various levels of aggregation. This service is recommended where the subscriber wishes to obtain foreign trade details for a large number of commodities. Details of this service are contained in the ABS information paper *Foreign Trade and Shipping Statistics: Microfiche Service* (5483.0).

*Magnetic tape service:* Statistics for imports, exports and import clearances are available on 9-track magnetic tape approximately 4 weeks after the end of the reference period. This service is recommended where the subscriber wishes to obtain trade data at the most detailed level. Documentation regarding the content and structure of these tapes is contained in the ABS information paper *Foreign Trade and Shipping Statistics: Magnetic Tape Service* (5484.0).

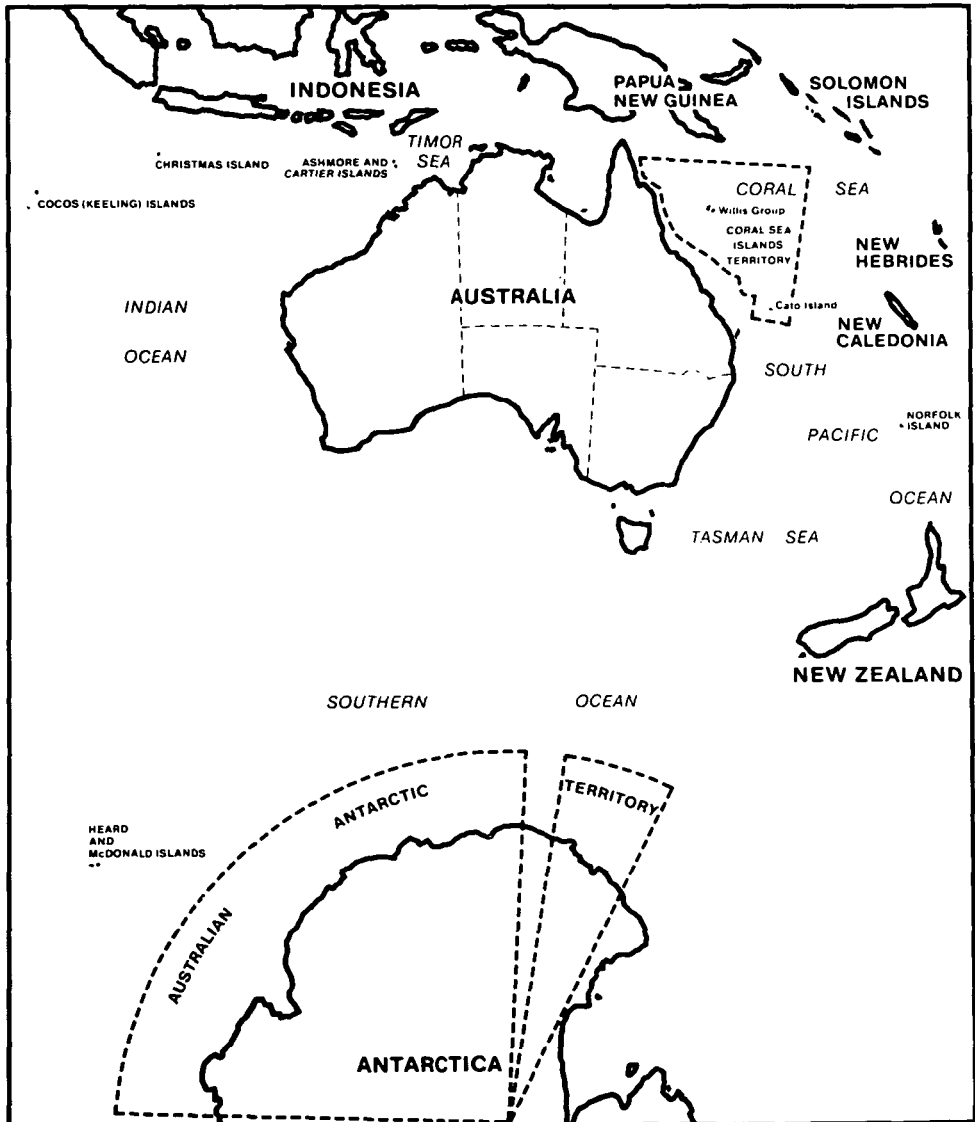

To meet subscribers' needs, special returns, microfiche and data on magnetic tape are available on a monthly, quarterly or less frequent basis. Payment in advance is required for each of these services.

## CHAPTER TWENTY-SEVEN

### THE TERRITORIES OF AUSTRALIA

The internal Territories of Australia are the Northern Territory and the Australian Capital Territory including Jervis Bay. The seven external Territories under Australian administration

Source—Promotion Australia

are: Norfolk Island; the Territory of Heard and McDonald Islands; the Australian Antarctic Territory; the Territory of Cocos (Keeling) Islands; the Territory of Christmas Island; the Coral Sea Islands Territory and the Territory of Ashmore and Cartier Islands.

More detailed statistics and additional descriptive matter are to be found in the Annual Reports of the administrations of the various Territories and in the *Northern Territory Statistical Summary* (1306.7) and the *Australian Capital Territory Statistical Summary* (1307.8) issued by the Australian Bureau of Statistics. Statistics for the Northern Territory and the Australian Capital Territory are also included in chapters dealing with particular subjects.

## THE NORTHERN TERRITORY

### General description

The total area of the Northern Territory is 1,346,200 square kilometres. The seat of Government is Darwin on the north coast. The estimated resident population of the Darwin Statistical Division at 30 June 1986 was 72,937.

### Northern Territory self-government

The Northern Territory was established as a self-governing territory by the *Northern Territory (Self-Government) Act 1978* of the Commonwealth. Under that Act, the Commonwealth transferred most of its powers to the Government of the Northern Territory.

In all fields of transferred power, the Government is similar to that of the Australian States, with some differences in titles, for example there is an Administrator instead of a Governor and a Chief Minister instead of a Premier.

The Administrator, appointed by the Governor-General, has responsibility for administering the Government of the Northern Territory. The Administrator is advised by an Executive Council composed of all Northern Territory Ministers, led by the Chief Minister, and acts with the advice of the Executive Council on all matters transferred to the Northern Territory. The Administrator acts with Commonwealth advice on matters not transferred.

The Legislative Assembly of the Northern Territory is the Northern Territory's Parliament. It has 25 Members, who are elected for a period of four years. A Speaker is elected by, and Ministers are appointed from, the Members of the Legislative Assembly. A Ministry of nine is responsible for the administration of all transferred powers and acts through a number of departments and authorities, most of which are staffed by the Northern Territory Public Service.

Local government was established in Darwin in 1957 and later in regional centres. Municipal councils are elected by universal adult franchise, with elections at intervals of not more than three years. Provision has been made for a limited form of local government by smaller communities. There has been considerable interest in this provision, particularly in Aboriginal communities.

### Development of administration

Upon the extension of New South Wales westwards to the 129th east meridian in 1825, the Northern Territory was incorporated in that colony, but in 1863 it was annexed by Royal Letters Patent to the province of South Australia. With the adjacent islands, it was transferred to the Commonwealth on 1 January 1911.

From 1911 until 30 June 1978, the Commonwealth administered the Northern Territory under the provisions of the *Northern Territory (Administration) Act 1910*, as amended. The Act provided for an Administrator, appointed by the Governor-General, to administer the Northern Territory on behalf of the Commonwealth Government.

By amendment of the Act in 1947, a Legislative Council comprising seven official and six elected members, with the Administrator as President, was created to make laws for the peace, order and good government of the Northern Territory. Composition of the Legislative Council was changed by further amendment in 1959 to provide for six official members, three nominated non-official members and eight elected members, and for an Administrator's Council to advise the Administrator. The Act was further amended in 1974 to provide for a Legislative Assembly of 19 elected Members and for a Speaker to be one of those Members, elected by the Members.

Laws passed by the Assembly were presented to the Administrator for assent. The Administrator was required to reserve laws on specific subjects for the pleasure of the Governor-General who was empowered to assent, withhold his assent or refuse his assent in part to such laws, or to return them to the Assembly with recommended amendments.

On 1 January 1977, the Commonwealth Government began a program of transferring executive powers to the Legislative Assembly by amendment of the Northern Territory (Administration) Act. A separate Northern Territory Public Service was created and administrative powers were transferred. Positions of Executive Member were created under the Act. These Members exercised ministerial-type powers in respect of transferred matters such as policy, fire brigade, local government and correctional services. An Executive Council replaced the Administrator's Council.

On 1 July 1978, the Northern Territory (Self-Government) Act came into force and established the Northern Territory as a body politic under the Crown. This Act also provided for the appointment of an Administrator by the Governor-General. It created offices of Ministers of the Northern Territory who, together with the Administrator, formed the Executive Council of the Northern Territory. A Northern Territory Government, comprising Ministers of the Northern Territory, was established with full responsibility for a range of State-type transferred powers administered through a Northern Territory Public Service and a Treasury. A Northern Territory flag was raised for the first time on 1 July 1978, the date upon which the Northern Territory became self-governing.

Major matters not transferred on 1 July 1978 were the mining of uranium and other prescribed substances, Aboriginal land matters, health, education and the Supreme Court. Powers in respect of health, education and the Supreme Court were progressively transferred from the Commonwealth to the Northern Territory Government during 1979.

At the end of 1979, the only major powers retained by the Commonwealth in the Northern Territory were those relating to rights in respect of Aboriginal land and the mining of uranium and other prescribed substances. Since the end of 1979, the Northern Territory, although remaining a Territory of the Commonwealth and still subject to Commonwealth laws made under Section 122 of the Constitution, is in most respects a self-governing Territory.

The Northern Territory is represented in the Parliaments of the Commonwealth by one Member in the House of Representatives and two Senators, whose terms of office coincide with that of the member in the House of Representatives. Since October 1984 the Cocos (Keeling) Islands have been included in the Northern Territory electorate for the purposes of all federal elections and referenda.

### **Physical geography and climate**

The Northern Territory has a mainland coastline that is 5,100 kilometres long, with a further 2,100 kilometres of coast around off-lying islands. A broad, shallow, low-gradient continental shelf, being less than 200 metres deep, runs for more than 140 kilometres offshore. Most of the coast is low-lying; cliffs, rarely exceeding 20 metres high, have been cut into weathered lateritic rocks, and there are active and cemented dunes, more than 50 metres high, on the western shore of the Gulf of Carpentaria. Coral reefs are best developed on the north coast and around off-lying islands. Most of the coastline consists of unvegetated mudflats, or mangrove swamps, which cover an area of approximately 2,400 square kilometres. The large tidal range of the north-western coast and the low gradient of the coastal lowlands means that some of the larger rivers are tidal for more than 100 kilometres upstream from their mouth. There are extensive seasonally-flooded coastal plains and black soil plains fringing the river systems, between the dissected lateritic lowlands, along much of the coast to the north-west and around the Gulf of Carpentaria.

Inland, the coastal lowlands merge into the dissected sandstone plateaux of Arnhem Land to the north, the granitic and sandstone Ord-Victoria river plateaux to the west, with rounded ridges of largely metamorphic rocks between those plateaux. The central section of the Northern Territory is formed of shallowly dissected lateritised sandstone ridges and sandplains. To the west there are the Lander dunefields with east-west trending longitudinal dunes, and to the east the black clay plains and limestone or sandstone rises of the Barkly Tablelands. The southern end of the Northern Territory is dominated by the Central Australian Ranges. These consist of granitic, sandstone and quartzitic ridges, separated by sandplains or stony lowlands. The folded Macdonnell Ranges, running east-west, contain the

highest point in the Territory, Mount Zeil, 1,511 metres high. To the south-east there is a part of the Simpson Desert with north-west south-east trending longitudinal dunes.

There are two main climatic divisions: the wet season from November to April; and the dry season from May to October. The changes of weather are uniform and regular. Nearly all the rainfall occurs in the summer months.

### **Fauna and flora of the Northern Territory**

The Northern Territory contains an immense array of faunal habitats, from arid deserts to the wet/dry tropics. Consequently, the fauna is characterised by both high species richness and species abundance, many of which are endemic to the Territory.

There are about 378 species of birds, 264 reptiles, 125 mammals, 42 amphibians and 100,000 species of insects, well represented by termites, ants and butterflies. In contrast to these distinctly Australian terrestrial fauna, the marine fauna of the Northern Territory is very similar to the Indo-Malay Archipelago immediately to the north.

The Northern Territory is famous for its herds of wild buffalo although introduced from Timor. There are also feral herds of banteng cattle, Timor ponies and samba deer which are confined to the Cobourg Peninsula.

The most distinct faunal region is centred on the sandstone escarpment of Arnhemland, including Kakadu National Park which is on the World Heritage List. Amongst the endemic fauna to be found there are the black wallaroo, the white-striped sheath-tailed bat, the black-banded pigeon and the white-throated and Carpentaria grass-wrens. There are also endemic fish (rainbow and primitive archer fish), insects (Leichhardt's grasshopper), and reptiles (Oenpelli python, a gekko, a stunted variety of Johnston's freshwater crocodile).

In the central deserts surrounding Alice Springs, the harsh climate promotes crypticism among the smaller native species, but plagues of rodents and small marsupials occasionally emerge following suitable rainfall. Distinctly Australian species include the bilby (a bandicoot), the thorny mountain devil (a lizard) and the Major Mitchell cockatoo. Snakes, many of which are venomous, are common throughout all habitats in the Territory. Introduced pests, especially the rabbit, can become extremely abundant in arid areas and constitute a serious threat to the pastoral industry. Similarly, the introduced fox and feral cats have been implicated in the decline or extinction of several native species.

Northern Territory vegetation is Australian in character although there is a significant component of the flora derived from the Indo-Malayan regions. In the 'Top End', the monsoon climate, the frequent fires associated with it and the poor soils, support eucalypt forests with open savanna understoreys. Pockets of monsoon forests, similar to rainforest, occur on sites with superior moisture supply during the seven month drought. Associated with the lower rainfall further inland, the height and density of forests decreases to form low woodlands. On the Barkly Tablelands and parts of the Victoria Rivers district, savanna with scattered shrubs occur. On the sandy plains of the interior and on the rugged sandstone escarpments, spinifex grasses predominate with occasional stunted shrubs. The country surrounding Alice Springs carries acacia scrub called 'mulga'. Where this community has been severely disturbed it is replaced by spinifex. There are some 180 different families of vascular plants in the Northern Territory, with over 3,000 species. However little of the area has been well studied and future exploration will add to our knowledge, especially in the central and northern portions of the Territory for which there are no published floras.

### **Water**

The Northern Territory Government provides water and sewerage facilities in four of the five major centres—Darwin, Alice Springs, Katherine and Tennant Creek. In the other major centre, Nhulunbuy, the mining company North Australian Bauxite Company provides those services. Facilities are also provided for numerous Aboriginal communities and all smaller gazetted towns such as Pine Creek, Mataranka, Elliott and Finke. Facilities for the new Yulara Tourist Village near Uluru (Ayers Rock) are provided by the Yulara Corporation, and in Jabiru they are provided by the Jabiru Town Development Authority.

Darwin is served by the Darwin River Dam, situated some 70 kilometres from the city. The rockfill dam was completed in 1972. The dam is 30 metres high with a crest length of 564 metres, has an active storage of 230 million cubic metres and a safe draft of 90 megalitres a day. Studies are also being carried out to identify future sources to meet the growing needs of the Darwin region.

Katherine is supplied with treated water from the Katherine River, but with the proposed development of Tindal RAAF base near Katherine, feasibility studies are in progress to assess future supplies from various dam sites on the Katherine River system.

Alice Springs, Tennant Creek and all other towns and communities are supplied by bores from groundwater sources. Alice Springs has twenty production bores at Roe Creek. Tennant Creek has ten at Kelly Well and three at Cabbage Gum.

### **Soil conservation**

The Conservation Commission of the Northern Territory administers soil conservation and control legislation, undertakes resource inventories to assess land capabilities and conducts soil erosion works on behalf of government and private sectors.

## **Population**

The population of the Northern Territory at 30 June 1986, was 154,848 persons. For further information, see Chapter 6, Demography.

## **Aboriginal affairs**

### **Policy**

The Government is committed to policies of Aboriginal self-management at all levels. Involvement of Aboriginals in delivery and planning programs, and in all stages of the development and implementation of policy is paramount.

The basis of the Government's approach is to secure access to government services for Aboriginals equal to that accorded other Australian citizens, together with additional services appropriate to Aboriginals' state of disadvantage, and in recognition of a community obligation deriving from Aboriginals' past dispossession and dispersal.

### **Legal status**

As Australian citizens, Aboriginals are entitled to equality before the law. For the purpose of administering various programs designed to benefit Aboriginals, the Department of Aboriginal Affairs and other Commonwealth Government departments and agencies define an 'Aboriginal' or 'Torres Strait Islander' as a person of Aboriginal or Torres Strait Islander descent who identifies as an Aboriginal or Torres Strait Islander and is accepted as such by the community in which he or she lives.

### **Land and land rights**

Aboriginals who are able to prove strong traditional links with unalienated Crown land may make a claim before the Aboriginal Land Commissioner, a judge of the Northern Territory Supreme Court. The *Aboriginal Land Rights (Northern Territory) Act 1976* requires the Land Commissioner, in hearing a claim, to consider a number of matters in addition to traditional ownership before making a recommendation to the Minister for Aboriginal Affairs. The Minister can then accept or reject the Aboriginal Land Commissioner's recommendations.

Minerals on Aboriginal land remain the property of the Crown. The Aboriginal Land Rights Act provides that mineral exploration can only proceed with the consent of the appropriate land council, which in turn must abide by the wishes of the traditional Aboriginal owners of the area concerned. Pre-existing mining interests were exempt from this requirement. In all cases where there is disagreement on terms and conditions, the Minister for Aboriginal Affairs is able to appoint an arbitrator.

Royalties from mining on Aboriginal land are paid into an Aboriginals Benefit Trust Account and are distributed to pay administrative expenses of land councils, to communities affected by mineral developments and, on the recommendation of an advisory committee, to Aboriginal communities of the Northern Territory generally. Control of uranium mining has been reserved by the Commonwealth and special arrangements have been made between the Commonwealth and the Northern Territory Governments in relation to payments in lieu of royalties.

# THE AUSTRALIAN CAPITAL TERRITORY

The Canberra district was first seen by white men less than 100 years before it was chosen as the site for the Australian National Capital.

In 1820, Governor Macquarie instructed Charles Throsby, a former naval surgeon interested in exploration, to search for the Murrumbidgee River which had been reported by Aborigines. Throsby sent Joseph Wild, an experienced bushman and explorer, with a party which included his nephew, Charles Throsby Smith and James Vaughan, to search for the Murrumbidgee. On this journey, the party camped on the plain on which Canberra now stands, and reported favourably on the district on their return. In subsequent years the country was opened up as grazing and farming land.

A high-angle, black and white photograph of Canberra, Australia, showing the city's layout, including the Parliament House and surrounding green spaces, set against a backdrop of hills and a cloudy sky.

Canberra today. *National Capital Development Commission (NCDC)*

The building of the national capital was a duty imposed on Parliament by section 125 of the Constitution, which reads — *The seat of Government of the Commonwealth shall be determined by the Parliament, and shall be within territory which shall have been granted to or acquired by the Commonwealth, and shall be vested in and belong to the Commonwealth, and shall be in the State of New South Wales, and be distant not less than one hundred miles from Sydney.*

*Such territory shall contain an area of not less than one hundred square miles, and such portion thereof as shall consist of Crown lands shall be granted to the Commonwealth without any payment therefor.*

*The Parliament shall sit at Melbourne until it meet at the seat of Government.*

After considering a number of possible sites the Commonwealth Parliament determined, in 1908, that the seat of government should be in the Yass-Canberra district and have access to the sea. The district Surveyor, Mr Charles R. Scrivener, was directed to examine the area and recommend a suitable site. Scrivener nominated 2,630 square kilometres in the watersheds of the Cotter, Queanbeyan and Molonglo Rivers and a further 930 hectares at Jervis Bay. A request for the surrender of the land was made to the New South Wales Government, and, after negotiation, an area of approximately 2,330 square kilometres between the Queanbeyan-Cooma Railway, and the mountain ranges forming the western boundary of the watershed of the Cotter River plus Jervis Bay was selected.

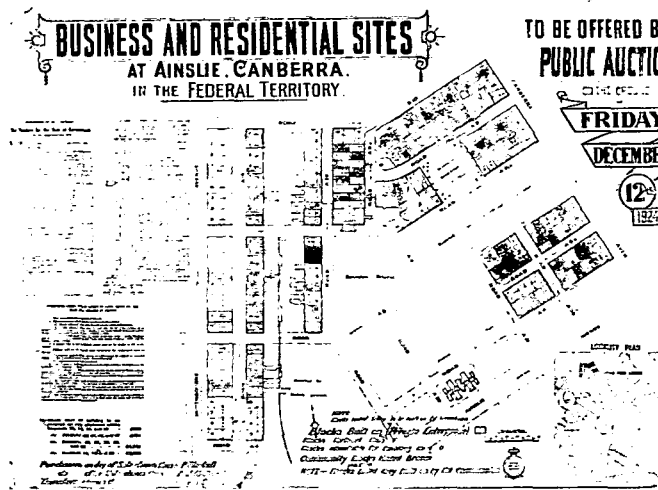

Control of the Territory was assumed by the Commonwealth on 1 January 1911, when the *Seat of Government (Administration) Act* came into force.

Surveyors camp, A.C.T., in the early 1900s. *Promotion Australia*

With the transfer of the Territory from New South Wales, all Crown land passed to the Commonwealth without cost, but privately owned land which the Commonwealth required had to be purchased from the owners.

The decision to vest ownership of all land in the Crown was a very significant social experiment. The intention, which has been maintained, was that the Crown would continue to own the land, but would lease it for specified periods and under given conditions for residential, commercial, industrial and other purposes.

COMMONWEALTH OF AUSTRALIA  
FEDERAL CAPITAL COMPETITION

CITY AND ENVIRONS

The Burley Griffin plan. NCDC

When the Commonwealth took control of the Australian Capital Territory in 1911 the site for the National Capital consisted of undulating grazing country, almost devoid of trees, the consequence of a harsh climate and the pastoral activities of the white settlers. The district population was 1,714 persons.

Seventy seven years later the limestone plains have been transformed into the garden city of Canberra with a population exceeding 250,000 people. It is one of the most outstanding urban landscape achievements seen in Australia and fast becoming one of the world's most beautiful capitals.

In April 1911, an international competition for the design of the new city was launched. From 137 designs received, the first prize was awarded to Walter Burley Griffin, a Chicago architect.

Fundamental principles of the Griffin plan were:

- The geometric pattern of the design;
- The treatment of the flood plain, useless for building purposes, to form a lake to be the unifying feature of the northern and southern parts of Canberra;
- The formation of a grand visual axis from the top of Mount Ainslie to Capital Hill; and
- The separation of national and municipal functions; this was proposed by the locating of all buildings associated with national affairs in an integrated group on the southern side of the lake and locating buildings associated with civic matters in a commanding position on the north side.

The basic Griffin plan has been closely followed in the development of Canberra.

Before the 'lake'. The War Memorial is in the foreground and beyond the flood plain is Parliament House. NCDC

On 12 March 1913, an official ceremony marked the formal establishment of the Seat of Government. The Foundation Stone was laid on Capital Hill jointly by the Governor-General, Lord Denman, the Prime Minister, Rt. Hon. Andrew Fisher, and the Minister for Home Affairs, the Hon. King O'Malley.

At this ceremony, Lady Denman announced Canberra as the name for the Capital City.

Before World War I brought activities almost to a halt, a power house was erected and a railway branch line from Queanbeyan was completed. Brick works were established, the Cotter Dam to store water for the city was started, and the Royal Military College was established at Duntroon.

Between 1921 and 1923 work on engineering services proceeded and main and subsidiary roads were formed. Residential buildings were started and sites were allocated for hotels and guest houses. The Canberra to Queanbeyan railway was opened for passenger traffic in 1923.

The Commonwealth Parliament continued to meet in Melbourne until 1927 when the new Parliament House in Canberra was opened by His Royal Highness The Duke of York (afterwards His Majesty King George VI) in 1927.

Construction ground almost to a standstill during the economic depression of the early 1930s, the only major work being the Federal Highway from Canberra to Goulburn.

As the economic situation improved again approval was given for the building of the Australian War Memorial and a building for the National Library, the recommencement of the administration building (on which work had started in 1927), the construction of the Patents Office, and the commencement of a new hospital. The growth in the city's population, though less than expected, necessitated the building of more roads, schools and public utilities. However the outbreak of World War II in 1939 diverted resources to military purposes, and house construction and transfer of government departments to Canberra were postponed.

Since 1962 the metropolitan growth of Canberra has been catered for in a series of new towns.

Three of these new towns — Woden-Weston Creek, Belconnen and Tuggeranong — are in various stages of development while planning has been undertaken for a fourth new town, Gungahlin. Together with inner Canberra, they will be capable of accommodating about half a million people. Canberra's population is now approaching 260,000.

The new towns are being planned and built with many of the characteristics of independent towns, with their own commercial, employment and retail centres, each having the potential to develop its own individual character. All will be linked by a comprehensive transportation system including roads, cycleways and an intertown public transport system and each will accommodate some of the national capital functions of Canberra.

One of these functions is the provision of office space for government departments and agencies which, with the development of private-enterprise facilities, assists in the decentralisation of employment opportunities to the new town centres.

After World War II Canberra's development quickened and a scheme to progressively transfer Commonwealth Government departments to Canberra was formulated. With a requirement for permanent administrative buildings, hostel accommodation and suburban growth to cater for the influx, the need for a single authority to coordinate planning, development and construction became evident. Subsequently the National Capital Development Commission (NCDC) was established and assumed control of Canberra's further development on 1 March 1958.

The new Commission endorsed the view that Canberra must have features to distinguish it from other cities, and that these features could emerge from the existence in the heart of Canberra of a large park-like landscape, bounded on the three sides by King's Avenue, Commonwealth Avenue and Constitution Avenue. The Commission also recommended to the Government that the Canberra lake, an essential feature of the original concept, should proceed. These proposals were approved by the Government. As well as being a simple and decorative feature in itself, the lake was also a fundamental requirement for the integrated growth of the approved city, as the recurring flooding of the Molonglo flood plain made it unsuitable for building sites. Major construction work was completed by the end of 1963 and the lake was named Burley Griffin after the man whose plan was responsible for its creation.

In August 1985, the Commonwealth Government announced an intention to amend the Aboriginal Land Rights Act on the basis of a preferred National Land Rights Model which the Government would like to see adopted in all States. This model proposes land claims to unalienated Crown land on the basis of traditional entitlement, historical association, long-term occupation and to meet specific needs. It would confer substantial rights in relation to mining on Aboriginal land but there would be no veto on exploration or mining.

Aboriginal communities are also being assisted to purchase land on the open market. The Aboriginal Development Commission, established in 1980, assists Aboriginal and Torres Strait Islander Communities, groups and individuals to acquire land for a variety of purposes, engage in business enterprises, obtain finance for housing and other personal needs, and to receive training where necessary.

### Community services and affairs

Government policy in the administration of Aboriginal affairs is to encourage State and Commonwealth departments and instrumentalities to provide services to Aboriginal Australians as to other Australian citizens and to take measures to ensure that these services are appropriate, accessible and reflect the variety of Aboriginal life styles.

### Special programs for Aboriginals

Attention is being given to changing the institutional character of Aboriginal communities in the Northern Territory. Assistance is designed to encourage and strengthen the capacity of Aboriginals to manage their own affairs, to increase their economic independence, and to reduce social handicaps facing them.

Government policy is to provide Aboriginal primary school children in Aboriginal communities with education in their own language as far as practicable. Bilingual education programs initiated in Northern Territory Aboriginal communities in 1973 now operate at 16 schools, using 12 Aboriginal languages. Aboriginal independent community schools, supported by the Government, also operate bilingual education programs.

### Land tenure

On 26 October 1987, 154,931 km<sup>2</sup> were held under freehold title; 746,320 km<sup>2</sup> under leasehold; 17,312 km<sup>2</sup> under various licences; 343,552 km<sup>2</sup> were Aboriginal freehold (this figure includes land granted under the *Aboriginal Land Rights (N.T.) Act 1976* and land which has since been claimed and over which title has issued); 824 km<sup>2</sup> set aside for government use; and 83,261 km<sup>2</sup> unalienated. Land rent collected for the year 1986-87 amounted to \$469,000.

Following the report of the Aboriginal Land Rights Commissioner in April 1974, the Commonwealth Government introduced the *Aboriginal Land Rights (N.T.) Act 1976*. This Act which commenced on Australia Day, 26 January 1977, gave traditional Aboriginals inalienable freehold title to former Aboriginal reserves and some other land, amounting to approximately 19 per cent of the Northern Territory, and provided a procedure for them to claim title to other areas of unalienated Crown Land.

With the commencement of the *Crown Lands Amendment Act (No. 3) 1980* most existing leases in the Territory were automatically converted to freehold tenure making it the rule rather than the exception. Most Pastoral Leases and all Special Purposes Leases were excluded from automatic freeholding.

Additional amendments to the Crown Lands Act were introduced in 1983 which enable Pastoral Lease holders to apply to have their leases converted to perpetual tenure after certain criteria have been complied with.

The various forms of lease or licence of lands are described below.

|                           |                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------|
| Pastoral leases           | —granted for periods not exceeding 50 years.                                                        |
| Perpetual pastoral leases | —granted in perpetuity and are only granted after certain criteria have been complied with.         |
| Crown leases (Term)       | —granted for a term of years, and in majority of cases can be converted to freehold when developed. |
| Crown leases (Perpetual)  | —granted in perpetuity.                                                                             |

|                         |                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Special purposes leases | —granted for a term of years or in perpetuity for purposes other than pastoral, agricultural or mining, or for private residential purposes within a town. |
| Grazing licences        | —granted to graze stock on Crown Lands for periods not exceeding one year.                                                                                 |
| Occupational licences   | —granted for manufacturing, industrial or any prescribed purposes for periods not exceeding five years.                                                    |
| Miscellaneous licences  | —granted for periods not exceeding one year.                                                                                                               |

## Production

### Pastoral and agricultural industries

Beef cattle production is the major rural industry in the Northern Territory. The beef industry has been characterised throughout its history by a slow rate of expansion due mainly to the quality of pastures in the top end of the Territory, periodic droughts in the Alice Springs district and remoteness from large domestic markets and other market infrastructure. Although the rate of expansion has been slow it has been persistent. Significant developments in the last two decades include: the establishment of a beef road system; expansion of market outlets, including live animal exports to Malaysia and Brunei; introduction of tropical cattle breeds in the northern regions; continued private investment in water supplies, fences and yards; and development of low cost aerial mustering techniques. Export licenced abattoirs now operate in Alice Springs, Tennant Creek, Katherine, and Point Stuart and Mudginberri on the northern coast. The latter three abattoirs process both cattle and buffalo for export. The gross value of cattle production in 1985-86 was \$108 million.

In the Darwin district, the cattle industry has continued to be augmented by the buffalo meat industry. Interest in buffalo control has received a significant boost due to the recent development of a high-priced live export trade with Indonesia. Buffalo surplus to the live export trade requirements continue to be slaughtered predominantly for the West German market. The gross value of the buffalo industry in 1985-86 was in the order of \$6 million.

Both the cattle and buffalo industries of the Northern Territory are experiencing dramatic changes in management practices due to a campaign to eradicate brucellosis and tuberculosis from the herds. The campaign requires all stock to be manageable to the extent where a 100 per cent efficient muster can be carried out so controlled stock are segregated and protected from possible infection by non-controlled stock.

In 1980 the Agricultural Development and Marketing Authority (ADMA) was established to develop broadacre cropping industries to the point where export sales were viable. The ADMA has developed six project farms in the Douglas-Daly basin, 250 kilometres from Darwin. These farms provide a commercial environment for the development of the required levels of agronomic and economic efficiency. ADMA operates as the handling and marketing authority for these and other non-project farmers in the Territory. Grain handling depots have been established at Katherine and Douglas-Daly. Gross value of production in 1985-86 was \$1.7 million.

### NORTHERN TERRITORY: NUMBER, AREA AND LAND UTILISATION OF AGRICULTURAL ESTABLISHMENTS

|                   | Number of agricultural establishments | Area used for crops (a) | Area under sown pastures and grasses | Balance of area (b) | Total    |                                                     |
|-------------------|---------------------------------------|-------------------------|--------------------------------------|---------------------|----------|-----------------------------------------------------|
|                   |                                       |                         |                                      |                     | Area     | Percentage of N.T. land area (134,620,000 hectares) |

(a) Excludes duplication on account of area double cropped.

(b) Used for grazing, lying idle, fallow, etc.

The horticultural industry in the Northern Territory has experienced very rapid expansion over the last five years. Value of production has increased from just over \$200,000 in the early 1980s to in excess of \$5 million in 1985-86. Very significant plantings of mangoes are as yet immature. The value of mango production is predicted to be in excess of \$10 million by 1990 and will continue to expand thereafter. Commercial trials of cashew production are being undertaken and it is expected that these will be the forerunner for a \$5 million industry. The top end of the Northern Territory has a natural advantage for horticultural production due to its capacity to produce the earliest maturing product in Australia for many lines of tropical fruit and vegetables. Table grape production in the Alice Springs district enjoys a similar advantage.

(a) Excludes pigs, poultry, milk and eggs.

## Mining

Northern Territory mining establishments have continued to increase from 1983. One of the main factors is the development of gold mining ventures in the Tennant Creek, Hayes Creek, Pine Creek, Tanami Desert and Alice Springs areas.

## NORTHERN TERRITORY: MINING ESTABLISHMENTS

|                                                          |     | 1983-84 | 1984-85 | 1985-86 |
|----------------------------------------------------------|-----|---------|---------|---------|
| Establishments operating end of June . . . . .           | No. | 17      | 21      | 26      |
| Average employment over whole year—persons (a) . . . . . | No. | 1,622   | 1,742   | 1,903   |
| Wages and salaries . . . . .                             | \$m | 47.4    | 49.5    | 57.7    |
| Turnover . . . . .                                       | \$m | 542.0   | 623.7   | 615.5   |
| Opening stocks at 30 June . . . . .                      | \$m | 150.4   | 168.4   | 153.7   |
| Closing stocks at 30 June . . . . .                      | \$m | 171.2   | 155.8   | 184.2   |
| Purchases, transfers in and selected expenses . . . . .  | \$m | 108.3   | 144.8   | 165.5   |
| Value added (b) . . . . .                                | \$m | 454.3   | 466.3   | 480.5   |
| Fixed capital expenditure (c) . . . . .                  | \$m | 24.2    | 61.5    | n.a.    |

(a) Includes working proprietors. (b) Turnover plus increase (or less decrease) in the value of stocks less purchases, transfers in and selected expenses. Commencing with 1978-79, 'rent, leasing and hiring revenue' and 'rent, leasing and hiring expenses' have been included in the calculation of value added and its components 'turnover' and 'purchases, transfers in and selected expenses'. (c) Outlay on fixed tangible assets less disposals.

The principal mining areas are the Alligator Rivers Region for uranium; Gove Peninsula for bauxite/alumina production; Groote Eylandt for manganese; and Tennant Creek for copper and gold.

The Department of Mines and Energy encourages and assists the development of an efficient mining and processing industry throughout the Northern Territory. Through five divisions, the Department administers relevant legislation and provides a wide range of services.

Mines Division acts as a single point of contact for all mineral mining related matters in the Northern Territory. In this context it is also responsible for controlling and ensuring the efficient, orderly and safe exploration for, and recovery and utilisation of, mineral resources in the Northern Territory. The Division formulates and implements policy and legislation designed to investigate the feasibility of mining and development proposals, provides technical advice to prospecting and mining operations, and strives for compatibility between mining and alternate land uses. It also administers all mineral titles and is responsible for the collection of mineral royalties.

The Geological Survey Division provides the essential scientific basis for the overall operations of the Department of Mines and Energy. The Division studies the regional geology and geophysics of the Northern Territory and publishes reports of this work for use by industry, other government departments and the public.

Energy Division is responsible for the development and implementation of energy policies, research into alternative sources of energy, planning of energy supply and consumption in the Northern Territory and for safety and environmental supervision of petroleum exploration. This includes promotion of the exploration for and development of indigenous energy resources, research into diversification of the Northern Territory's energy base, energy conservation and security.

Alligator Rivers Region is responsible for the oversight and co-ordination of all stages of uranium mining, milling and rehabilitation processes in the area. The unit is the focal point for the industry and the public for matters concerning uranium mines in the Northern Territory.

### **Offshore petroleum resources**

The development of offshore petroleum resources is set to change the entire progress and development of the Northern Territory.

BHP Petroleum, which is putting 50 per cent of its Australian exploration effort into the search for oil in the Timor Sea, recently doubled production from the Jabiru venture with the addition of another subsea well and by modifying facilities. Production is now about 29,000 barrels per day.

In August 1987, the Minister for Mines and Energy, authorised the release of four new exploration areas in the Bonaparte Gulf and the Arafura Sea, and the interest shown by the petroleum industry is an optimistic indicator of the promise of these regions.

The Timor Sea is Australia's most promising offshore area, and the increasing activity is heralding a substantial growth in production over the next couple of years. Expenditure on exploration and production in 1986 reached a record \$120 million, treble the amount spent in the previous year. Geophysical activity, which usually precedes drilling, also established record figures in 1986. More than 11,000 kilometres of seismic survey line was run, double the previous year's figures.

### **Forestry**

Forestry activities in the Northern Territory commenced in 1959 under the Forestry and Timber Bureau; later a State-type service was developed under the Department of the Northern Territory.

In July 1978, with the granting of self-government, forestry became the responsibility of the Territory Parks and Wildlife Commission, now the Conservation Commission of the Northern Territory.

Present activities fall into four main areas: Urban Forestry, Plantation Forestry, Native Forest Management and Conservation.

The Urban Forestry section is aimed at improving the urban environment throughout the

Northern Territory through programs of park and street beautification and arid area species testing.

The Plantation Forestry section is predominantly based on plantation establishment on more favourable sites on Melville Island and is ultimately aimed at import replacement. The major species in use is *Pinus caribaea*, though early plantings were largely cypress pine. A small pressure treatment plant providing treated round timber is operated by the Aborigines on nearby Bathurst Island.

Management of native forest is currently confined to the Murganella area of Arnhem Land where a policy of protection from fire has resulted in extensive regeneration of cypress pine and native hardwoods, *Eucalyptus tetradonta* and *E. nesophila*. Current research in this area is aimed at development of sound management prescriptions for treatment of this regeneration.

In its conservation role, the Conservation Commission has given emphasis to fire and ecological studies throughout the Territory together with seed collection, testing and propagation, and gene pool conservation of rare or unique species.

### Fishing

Seafoods landed in the Northern Territory in 1985-86 totalled 5,998 tonnes and had an estimated value of \$29.38m. Prawn fishing continues to dominate the industry with 3,302 tonnes being landed, worth an estimated \$24.66m. Barramundi remains the second most important species fished. Landings stood at 609 tonnes and were valued at \$1.75m. In order of estimated landed value, mackerel, mud crabs, threadfin salmon, snapper, shark, bay lobster, bream, scallops and squid are the next most important species taken.

Management control measures have been introduced in the prawn, barramundi and mud crab fisheries in order to prevent over-exploitation of these fisheries resources.

Under an agreement to 31 July 1987, 50 pairs of Taiwanese trawlers were permitted to catch up to 15,000 tonnes of fish from areas off the north and north-west coasts of Australia. The western boundary of the authorised area (116° E longitude) was moved eastward to 117°30' E longitude after 31 July 1987, an adjustment which was considered necessary to ensure that development of an Australian Fishery would not be inhibited.

#### NORTHERN TERRITORY: PRINCIPAL FISHERIES

### Secondary industries

The types of secondary industries that have developed in the Northern Territory have been largely based on demand from the local markets, some processing of primary production for exports, including the processing of mined ores and beef, together with exports in the mining and construction industries.

The isolation of the Northern Territory from the major population areas of Australia and resultant high transportation costs make other than local market expansion difficult.

While industry is limited to local markets, industrial expansion will be small. However determined efforts are being made to take advantage of the proximity of Darwin to the rapidly expanding South East Asian markets. It is envisaged that in the longer term secondary industry will be largely export based.

The following table shows results of the Manufacturing Censuses taken in respect of the years 1982-83 to 1984-85.

---

**NORTHERN TERRITORY: MANUFACTURING ESTABLISHMENTS**

(a) Average over whole year. Includes working proprietors.

## Tourism, parks and reserves

Tourism is second only to mining as the Territory's most important industry with direct earnings for 1985-86 estimated at \$300 million.

In 1981-82, 411,000 people travelled to the Territory, increasing to approximately 710,000 in 1986-87, representing an average visitor growth rate of 12 per cent. This growth rate continues to encourage investment in tourism facilities and, since the early 1980s, well over \$600 million has been invested in tourism-related facilities in the Territory.

Major developments include the Darwin and Alice Springs Casinos, the Yulara Resort, Sheraton Hotels in Alice Springs and Darwin, and the Beaufort Hotel and Convention Complex in Darwin. Major development plans include wilderness attractions and facilities at Kings Canyon, Litchfield Park and Cobourg Peninsula.

The Northern Territory Tourist Commission has had responsibility for the promotion of tourism since it was formed in 1980. It has its head office in Alice Springs, a regional office in Darwin and bureaux in all States with two each in New South Wales and Victoria, plus overseas regional offices in London, Los Angeles, Tokyo, Frankfurt, Singapore and New Zealand.

In 1986, and again in 1987, the Commission won the Australian tourist industry's most prestigious accolade, the National Award for the Best Australian Tourism Authority/Commission.

The Tourist Commission's budget for the 1987-88 financial year is \$13 million.

There are 52 parks and reserves, covering about 5,800 square kilometres, under the care, control and management of the Conservation Commission of the Northern Territory. The Commission's functions include the preservation and protection of natural and historical features and the encouragement of public use and enjoyment of land set aside under its control.

In addition, the Gurig National Park (2,207 square kilometres) is managed by Cobourg Peninsula Sanctuary Board, and the Kakadu National Park (15,923 square kilometres) is managed by the Australian National Parks and Wildlife Service. Uluru National Park (Ayers Rock-Mt Olga) is managed by the Australian National Parks and Wildlife Service in conjunction with the park's traditional Aboriginal owners. Visitors to Uluru National Park have increased from an estimated 86,900 in 1981 to approximately 220,000 in 1987 while at Kakadu numbers have increased from 31,500 to an expected 195,000 in the same period.

## Railways and roads

### Railways

Passenger and freight train services commenced in December 1980 over the then new 831 km standard gauge Tarcoola-Alice Springs railway. Direct services from Sydney to Alice Springs commenced in 1984.

### Roads

The Stuart Highway is the principal north-south axis route for the Northern Territory connecting Alice Springs, Katherine, Tennant Creek and Darwin to Adelaide. The section Darwin-Alice Springs is 1,486 kilometres long and sealed over its full length. The section south of Alice Springs is sealed to the South Australian border, a distance of 292 kilometres.

The Barkly Highway is the principal route to and from Queensland via Mount Isa. It is 636 kilometres long, 432 kilometres of this being within the Territory, and is sealed. Running approximately east-west, it connects to the Stuart Highway some 26 kilometres north of Tennant Creek.

The Victoria Highway, the principal access route to and from Western Australia via Kununurra, is 468 kilometres from Katherine to the Northern Territory border and is sealed.

These highways are used to carry a variety of freight, including cattle, particularly between the railheads at Mount Isa and Alice Springs. They provide access to meatworks at Wyndham (Western Australia), Cloncurry (Queensland) and Katherine. In addition, they play a particularly important part in the Northern Territory economy through their association with the tourist industry.

The program for upgrading the Stuart and Barkly Highways was commenced in the early 1970s and the ongoing program is continuing to bring these roads to National Highway Standards. A strategy to upgrade the Victoria Highway is being developed.

## Education

Responsibility for education in the Northern Territory was transferred from the Commonwealth Department of Education to the Northern Territory Government on 1 July 1979.

Details of the responsibilities are outlined in the *Northern Territory of Australia Education Act 1979*. Under the Act, the Minister for Education is responsible for the general administration and control of education services. The Act states that the Minister may take all measures which, in his opinion, are necessary or desirable to: assist parents in the Territory in fulfilling the responsibility to educate their children according to the individual needs and abilities of those children; make education services, provided by the Minister, available to all people in the Territory; and, assist all people of the Territory with their own education. The Act also provides for the establishment of advisory councils.

### Schools in the Northern Territory

There are some 160 schools in the Northern Territory with a total student population of approximately 35,000. About one-third of students are of Aboriginal descent. In addition to primary and pre-schools, there are 11 government high schools, one secondary correspondence school and three private high schools. There are three area schools offering secondary courses and two residential colleges for Aboriginal students. There are also 16 government schools in Aboriginal communities that offer post-primary courses and six mission schools with post-primary programs.

Teaching staff are provided by the Northern Territory Teaching Service and qualified applicants are recruited from all parts of Australia.

With the exception of Year 12 level, where most students are assessed by the Senior Secondary Assessment Board of South Australia, all aspects of curriculum, course accreditation and student assessment are the responsibility of the Northern Territory Board of Studies, with subject area committees in English, Languages other than English, Mathematics, Science, Computer Education, Social and Cultural Education, the Arts, Health and Physical Education and Life/Work Skills. Apart from Life/Work Skills, which is concerned with secondary education only, all committees span primary and secondary education from Transition to Year 12.

Subject area committees define the core of essential skills and understanding in which all students should gain competence and the educational experiences which they should have during their primary and junior secondary schooling. They also identify or develop the recommended curricula, which consists of those courses and materials which are regarded as the best available to assist schools in achieving the objectives specified in the core, as well as skills, understanding, content and experiences considered appropriate for extension beyond the core.

In addition to curriculum development, subject area committees provide for guidelines on the assessment of student performance, examples of assessment instruments and, in some subjects, moderation of student assessment. The Junior and Senior Secondary Studies Certificates are issued by the Northern Territory Board of Studies at Year 10 and Senior levels respectively.

The work of subject area committees is co-ordinated and supplemented by curriculum officers at central and regional levels and by a range of educational services.

The two Schools of the Air in the Northern Territory, one at Katherine and one at Alice Springs, have developed individual programs and provide correspondence and radio lessons for students in the Years One to Seven. One correspondence school caters for isolated secondary students. Aerial and road patrols are carried out regularly to provide teacher-student and parent contact.

Special schools are located in Alice Springs and Darwin for handicapped children. However, where appropriate, students with special needs are integrated into primary and secondary schools. Guidance and Special Education Advisory Services operate from the two regional offices in Alice Springs and Darwin.

A program of exchange between Indonesia and the Northern Territory is continuing in which up to two teachers from each country are exchanged for a school year, and four senior students spend up to six months in each country. In addition, the Northern Territory Department of Education encourages school-organised excursions to Bali and other South East Asian localities.

### **Aboriginal education**

Most Northern Territory Aboriginals live away from town centres and their education is provided in various settings including mission schools, government schools on or near settlements or Aboriginal townships, on pastoral properties and outstations or homeland centres.

There has been an increasing number of requests from outstations for the Department of Education to provide assistance with Aboriginal education. A small group of teachers is currently working in this field and developing special methods and modified courses to help overcome the difficulties faced by isolated outstation groups in their quest for education.

Government schools for Aboriginal children in out-of-town centres provide tuition at pre-school and primary school level with a number of them providing post primary (secondary age) classes as well.

For Aboriginal children who wish to proceed to secondary schools there are now two residential colleges: Yirara and Kormilda. These colleges are regionally based but situated near urban centres, Yirara at Alice Springs and Kormilda in Darwin. They provide secondary age students from outlying centres with the opportunity to undertake a range of courses at an urban high school.

Bilingual education programs in Northern Territory schools in Aboriginal communities have attracted wide interest from within Australia and overseas. There are 16 schools offering bilingual programs to approximately 3,500 students. Many other schools include Aboriginal language and culture in the curriculum. Fourteen languages are now being used in the program and 6 further languages are under consideration. Many school children are acquiring initial literacy skills in their own language. Half of the curriculum is devoted to instruction in an Aboriginal language, and during the other half a structured English course forms an integral part of the bilingual program. Other aspects of Aboriginal education are covered in the TAFE section.

### **Technical and Further Education—TAFE**

Technical and further education services in the Northern Territory are provided by the Darwin Institute of Technology and the Department of Education through its Institute of Technology and Further Education Division.

The Department has a number of TAFE Colleges and services the TAFE Advisory Council which advises the Minister for Education on Territory-wide TAFE policy issues. The Council membership includes representatives of employer and employee organisations and Northern Territory TAFE colleges.

The TAFE Colleges in the Northern Territory are outlined below.

#### **Darwin Institute of Technology**

The Institute was opened in 1974 as the Darwin Community College and was redesignated the Darwin Institute of Technology in 1985. It is an autonomous multi-level institution offering over 100 award programs in both advanced education and technical and further education, and a wide range of non-award recreational and continuing education programs.

The campus covers 58 hectares at Casuarina in Darwin's northern suburbs, 13 kilometres from the city centre, and the School of Australian Linguistics is located at Batchelor.

Advanced education programs are offered at degree, post-graduate diploma and associate diploma level. Technical and further education programs are offered at certificate, trade certificate, post-trade certificate and apprenticeship trade course level.

The Institute also provides examination facilities and some tutorial assistance to external students in the Northern Territory studying at other Australian Institutions, through the External Studies Centre at the Casuarina campus. International programs are offered through the School of Extension Services. In 1987, 1,469 nett students were enrolled in advanced education programs, approximately 4,220 nett in TAFE award courses and approximately 3,600 nett students in non-award courses.

#### Alice Springs College of TAFE

Formerly the Community College of Central Australia, the Alice Springs College of TAFE is a multi-sector, multi-campus institution which provides recreational, remedial, pre-trade, trade and para-professional studies. It has three campuses and has expanded rapidly in recent years in response to increasing demands.

#### Katherine Rural College

The Katherine Rural College was established to train people for employment in the Northern Territory rural industry. It offers a two-year, full-time residential course, leading to a Certificate in Rural Studies, intensive three-month long courses in basic stock-handling and station skills and short courses in areas such as horse-handling, horse-shoeing, explosives, welding, farm mechanics, pregnancy diagnosis and artificial insemination of cattle.

The College has a 3,440 hectare property north of Katherine and a 1,000 square kilometre property at Mataranka, south of Katherine.

#### Batchelor College

Batchelor College is a residential institution providing programs for Aboriginal people which lead in particular to teaching qualifications at advanced education and TAFE levels. The College also offers courses for Aboriginal adult educators and conducts courses related to community management. The College is situated in the town of Batchelor.

#### N.T. Open College

The Northern Territory Open College is a distance education institution which opened in January 1987 and offers services through a network of education centres and through lecturers based in many communities.

## Finance

The following table gives details of government revenue and outlays that have been identified as relating specifically to the performance of local or State-type functions in the Northern Territory from 1983-84 to 1985-86. Receipts collected in the Northern Territory from Australia-wide sources (e.g. income taxes, customs duties, etc.) and outlays in the Northern Territory on items of a national character (e.g. defence, civil aviation and cash benefits paid to Northern Territory residents as part of national programs) are *not* included.

| Commonwealth Government grants . . . . .                                    | 740.6        | 829.0          | 836.0          |
| Commonwealth Government advances . . . . .                                  | 88.9         | 84.1           | 102.5          |
| Net borrowing . . . . .                                                     | 74.4         | 75.0           | 65.3           |
| Other financing . . . . .                                                   | -58.7        | -68.8          | 41.1           |
| <b>Total Receipts . . . . .</b>                                             | <b>970.9</b> | <b>1,075.3</b> | <b>1,217.7</b> |

In addition to transactions relating to the Northern Territory in the Consolidated Revenue Fund and certain trust funds, the transactions of the following public corporations are included: Northern Territory Port Authority, Northern Territory Housing Commission, Northern Territory Electricity Commission, Corporation of the City of Darwin, Corporation of the municipalities of Alice Springs, Jabiru, Katherine, Litchfield, Palmerston and Tennant Creek.

## THE AUSTRALIAN CAPITAL TERRITORY

### General description

The Constitution provides that the Seat of Government of the Commonwealth of Australia shall be in the State of New South Wales but distant not less than 160 kilometres from Sydney. After a number of alternative sites were considered, an area of 2,359 square kilometres, lying approximately 320 kilometres south-west of Sydney, was transferred to the Commonwealth as from 1 January 1911. A further 73 square kilometres at Jervis Bay were transferred as from 4 September 1915 to serve as a port for the Territory.

The primary responsibility for administering the Australian Capital Territory lies with the Australian Capital Territory Administration, within the Department of the Arts, Sport, the Environment, Tourism and Territories. The A.C.T. Administration's responsibilities cover most functions carried out by State and municipal governments, including the leasing and management of land, housing, public transport, forestry, municipal and community services, general works, commercial regulation, industrial relations, employment and vocational training, legislative drafting, education and public health. Responsibility for policing and the courts lies with the Attorney-General's Department. Within the A.C.T. Administration, the National Capital Development Commission has the responsibility for the planning and development of Canberra.

The Australian Capital Territory has no formal system of local government.

As at 30 June 1986 the population of the Australian Capital Territory was 249,407.

### Housing

In May 1987, the Government formally approved the alignment of A.C.T. public housing operations with the Commonwealth-State Housing Agreement (CSHA) from 1 July 1987. As a result of this decision, Commonwealth funding assistance for public housing in the A.C.T. will be provided on a similar basis to that provided to the States under the CSHA.

The role of the A.C.T. Administration in the area of housing has changed significantly since 1930 when, as the Department of the Interior, it offered rental accommodation to public servants in Canberra. The proportion of houses and flats in the Australian Capital Territory occupied by tenants of the Administration has fallen steadily from 79.7 per cent of total occupied houses and flats in 1954 to 58.3 per cent in 1961, 28.1 per cent in 1971, 13.0 per cent in 1984, and 12.9 per cent in 1985. This proportion remained the same in 1986, and rose slightly to 13.0 per cent in 1987.

Although there has been a considerable increase in the proportion of home ownership in the Australian Capital Territory since 1954, the demand for public housing has continued to increase. At June 1981 there were 2,126 persons on the waiting list for public housing. There were 1,554 in 1982; 1,757 in 1983; 2,141 in 1984; 2,756 in 1985; 1,781 in 1986, and 2,080 in 1987. Housing resources have not been able to keep pace with the demand; therefore rental accommodation and housing finance are now allocated on a means tested basis.

The Administration, in conjunction with the National Capital Development Commission, has endeavoured to expand public housing stock through annual building programs. The 1986-87 building program provided for the commencement of 525 dwellings and it is expected that 300 dwellings will be commenced during 1987-88.

Both private and public home building activity have continued to expand the stock of residential dwellings in the Australian Capital Territory. At June 1987 there were 22,908 occupied dwellings in the Central Canberra area; 20,176 in the Woden Valley and Weston Creek area; 26,872 in the Belconnen area; 16,395 in the Tuggeranong area; and 115 elsewhere in the Australian Capital Territory. The total number of occupied dwellings in the Australian Capital Territory at June 1987 was 86,466.

For further information *see* Chapter 20, Housing and Construction.

## **Parks and conservation**

Since its establishment, Canberra has been developed as a garden city. The A.C.T. Parks and Conservation Service manages the urban open space in the Territory, including national parks, reserves, parkland, sportsgrounds, public surrounds, rural picnic grounds and other landscaped public areas. The total urban area managed during 1986-87 increased by approximately 320 hectares to a total of 9,200 hectares.

The Yarralumla Nursery, established in 1913, propagates trees and shrubs for use in development projects, as replacements in landscape maintenance and for issue to buyers of new home sites. In 1986-87, 481,270 trees and shrubs and 34,444 annual plants were produced.

The Horticultural Services Unit provides horticultural advice and tests turf grasses, trees, shrubs and new products and techniques for application in the Canberra environment.

### **Namadgi National Park**

In June 1984 the former Gudgenby Nature Reserve (62,000 hectares) and part of the Cotter River Catchment (32,000 hectares) were combined to form a new national park. It is known as Namadgi and covers 40 per cent of the Australian Capital Territory. Namadgi shares a common boundary with the magnificent Kosciusko National Park (520,000 hectares) and other reserves in neighbouring New South Wales.

The topography and landscapes of Namadgi National Park and, consequently, the plant and animal communities, are extremely varied and include the only parts of the Territory with a sub-alpine climate. Habitat ranges from grassland of the valley floors, through woodland and mountain forest to sphagnum bogs, heath swamps and alpine woodland. Several high peaks rise to over 1,800 metres above sea level and include Mount Bimberi, the highest peak in the Australian Capital Territory.

### **Tidbinbilla Nature Reserve**

The Tidbinbilla Nature Reserve (5,515 hectares) is located 43 kilometres south-west of Canberra. The Reserve includes much of the Tidbinbilla Valley, which ranges from 762 metres above sea level to 1,561 metres at Tidbinbilla Peak, the highest of the Tidbinbilla Range which forms the western boundary of the Reserve. As a consequence of the valley topography, many habitats are represented and plant and animal wildlife is diverse. A system

of wildlife enclosures and waterfowl ponds, 30 kilometres of nature trails and a comprehensive information service are provided for approximately 120,000 visitors a year.

### **Black Mountain Reserve**

The Black Mountain Reserve (521 hectares), adjacent to Lake Burley Griffin, is a significant focal point in the Canberra landscape and an essential component of the 'mountain and lake' concept of the Canberra scene. Black Mountain Reserve is unique in its setting within the inner boundary of a national capital. In addition to broad scale scenic attributes, the Reserve has a varied complex of flora and fauna and is used extensively for recreation and nature study. Black Mountain Reserve is part of a number of urban reserves which make up Canberra nature parks.

### **Jervis Bay Nature Reserve**

The Jervis Bay Nature Reserve occupies two-thirds (4,520 hectares) of the Commonwealth Territory of Jervis Bay which lies on the south-east coast of Australia. The Reserve is characterised by a substantially natural landscape and outstanding coastal scenery, high cliffs, ocean and bay beaches, sand dunes, woodland, forest and heath. Bowen Island is now gazetted as part of the Reserve. Parts of the unspoilt marine environment of Jervis Bay and its foreshores are managed in sympathy with the Nature Reserve. Camping facilities are provided and are designed to complement the natural values of the area which attracts over 500,000 visitors annually.

Management aims for all nature reserves in the Australian Capital Territory and Territory of Jervis Bay are to:

- maintain natural ecosystems and landscapes and protect sites of prehistoric and historic significance;
- provide opportunities for recreational, scientific and educational use of these resources consistent with their protection.

### **Wildlife**

Extensive surveys and investigations of the vertebrate fauna of the Australian Capital Territory are continuing, and active management of some species is necessary. For example, collaborative research by A.C.T. Parks and Conservation service staff and scientists from CSIRO have developed techniques for the control of feral pigs in Namadgi National Park. Macquarie perch is a rare and endangered fish species which was once common in south-eastern Australia. Small populations occur in streams in the Territory, and these are being regularly monitored. Stocks of native fish species are maintained in Canberra's lakes, with regular stocking of silver perch, golden perch and murray cod.

### **Soil conservation**

Rivers and lakes of the Australian Capital Territory are protected from serious siltation by a program of works in the Territory and adjoining areas of New South Wales, and by controls on methods of land development and use.

Lake Burley Griffin is protected under a collaborative works project between the Commonwealth, the State of New South Wales, and landholders in the lake's catchment. The scheme, commenced in 1966, is designed to remedy soil erosion problems and to promote sound land management practices. The A.C.T. Administration and the CSIRO are studying the lake sediments to help determine the main sources of sediment, and so to decide works priorities in the catchment.

### **Land tenure**

Reference has been made in earlier issues of the *Year Book* to the general conditions of land tenure in the Australian Capital Territory and to the area of alienated and leased land.

With minor exceptions, the freehold estate of land in the Australian Capital Territory has been acquired by, and is vested in the Crown. The *Seat of Government (Administration) Act 1910* prevents the sale or disposal of such Crown land for any estate in freehold, except in the case of a contract that preceded the Act. Progressively the remaining areas of freehold land are being acquired.

Leases of land for residential, commercial and other purposes in the city area are usually granted under the *City Area Leases Ordinance 1936*. Some special leases for other purposes (such as diplomatic sites or churches) are granted under the *Leases (Special Purposes) Ordinance 1925* or the *Church Lands Leases Ordinance 1924* or the *Leases Ordinance 1918* if for a short term or experimental land use. Some areas outside the city area not immediately required for the development of the city or for other public purposes or where there is no intention of development, are leased for agriculture or grazing under the *Leases Ordinance 1918*.

The Commonwealth Territory at Jervis Bay, comprising about 7,360 hectares, was acquired from New South Wales for the possible provision of port facilities in connection with the Australian Capital Territory. A portion of the area is occupied by the Royal Australian Naval College (*H.M.A.S. Creswell*) and a Royal Australian Navy airfield. Several blocks fronting Sussex Inlet plus an area on Bowen Island have been leased for guest houses and holiday camps, etc., under the *Leases Ordinance 1918*, and an area of land in the Murray's Beach area has been set aside for possible use as an atomic power station under the control of the Australian Nuclear Science and Technology Organisation (ANSTO). An Aboriginal community is located at Wreck Bay. On 14 March 1987, the Federal Minister for Aboriginal Affairs transferred ownership in perpetuity of 403 hectares of land at the Wreck Bay township to the local Aboriginal community.

## Production

### Forestry

Forestry field operations in the Australian Capital Territory began in 1915 with the planting of pines on the denuded slopes of Mount Stromlo to arrest soil erosion and to improve the visual quality of the landscape. In 1926, a program for development of commercial forests was approved following a comprehensive review of the Territory's potential for forest development. Major reviews of this program were made in 1932, 1954, 1967 and 1984; always, however, retaining the basic policy of systematic conservation and development. Forestry operations, including fire protection treatment, extend to some 13,000 hectares of natural forest in the Cotter catchment and adjacent areas and the Kowen region. The more productive stands in these areas were harvested extensively to provide timber for Canberra's post-war expansion and were subsequently treated to promote regeneration and protect the quality of water harvested.

Forest management in the Australian Capital Territory has been formulated to cater not only for commercial timber production but also to provide recreation facilities, an attractive visual environment for the national capital, to protect the water supply catchment and for appropriate wildlife conservation.

The forest authority is charged with the management of some 37,100 hectares of land in the Australian Capital Territory. As at 30 June 1987, the total area of coniferous plantations in the Australian Capital Territory and Jervis Bay was 15,775 hectares nett. Of 220 hectares at Jervis Bay, the majority consisted of *Pinus radiata* (Monterey Pine) and *Pinus elliotti* (Slash Pine). The plantations in the Australian Capital Territory consisted mainly of *Pinus radiata* and *Pinus ponderosa* (Yellow Pine). Total area of *Pinus radiata* was 14,900 hectares.

In 1986-87 there was no commercial production of hardwood timber from the Australian Capital Territory or Jervis Bay. The volume of softwood cut was 173,000 cubic metres. The total value of this unprocessed timber unloaded at the mill (mill door value) was \$7.7 million.

### Agriculture

Since 1974-75 the number of agricultural establishments in the Australian Capital Territory has fallen. In 1986 there were 140 rural lessees. In 1986-87 small amounts of wheat and oats for grain and fodder were grown. Livestock numbers at 31 December 1986 included 13,181 cattle, 119,393 sheep and over 1,000 horses.

---

## Commercial operations

### Consumer affairs

The Consumer Affairs Bureau receives and investigates complaints from consumers concerning unfair commercial practices, including credit transactions. It conducts research into matters affecting consumer interests and provides information of benefit to consumers. The Bureau also provides advice to both landlords and tenants in relation to residential tenancies, and acts as a watchdog on product safety matters.

### The Trading Standards Office

Formerly the Weights and Measures Office, the Office maintains the standards of mass, length and volume for the Australian Capital Territory. It periodically examines all scales and measures used for trade and checks the weight or measures of packaged goods sold in retail premises. The Office also receives and investigates consumer complaints in relation to weights and measures problems.

### Licensing

In the Australian Capital Territory, licensing schemes are established as a means of regulation, consumer protection, and of setting minimum standards of qualifications and experience for entry into certain occupations. Commercial activities such as credit provision, finance broking, bookmaking (racing industry), sale of motor vehicles, sale of real estate and stock station and business agencies are controlled by legislation requiring licensing or registration.

### Gaming and liquor

The Gaming and Liquor Authority was established to control outlets engaged in the supply of liquor and to control gaming machines in the Australian Capital Territory.

### A.C.T. Credit Tribunal

The A.C.T. Credit Tribunal is an independent Tribunal established by the *Credit Ordinance 1985* to adjudicate between credit users and credit providers in matters arising under the Ordinance. It also decides as to the grant of licences to credit providers and finance brokers to engage in those businesses.

### Co-operative societies

*The Co-operative Societies Ordinance 1939* provides for the incorporation of building societies, trading, housing and service societies and credit unions. The Registrar is responsible for the incorporation of new societies, registration of documents, inspections, and inquiries into the working and financial situation of societies and the hearing and determination of certain disputes between a society and a member.

### Workers' compensation

A workers' compensation scheme was established by the *Workers' Compensation Ordinance 1951*. Under this scheme, the nominal insurer is liable to pay workers' compensation if a worker is not insured or if an employer defaults in compensation payment.

### Registrar's Office

The Registrar's Office controls both Land Titles and Births Deaths and Marriages Offices. The Land Titles Office is responsible for registration of Land Titles dealings, Miscellaneous Deeds (e.g. Powers of Attorney) and Instruments (e.g. Bills of Sale) whilst the Births Deaths and Marriages Office registers all Australian Capital Territory births, deaths and marriages.

### Public Trustee

The Office of the Public Trustee is a corporation established by the *Public Trustee Ordinance 1985*. Its main responsibilities are connected to the role of trustee, administrator, executor, attorney, agent and manager of property in relation to wills or settlements, under the Ordinance.

## Transport and communication

The A.C.T. Central Administration Office is responsible for the regulation of transport and traffic under an A.C.T. Ordinance. ACTION, the Australian Capital Territory Internal Omnibus Network, is also operated by the A.C.T. Central Administration Office. It operated 398 buses in 1986-87 over 118 routes covering 1,524 kilometres. A total of 16,192,400 kilometres was travelled and 24,151,800 passenger journeys made.

There are eight radio broadcasting stations currently in the Territory: 2CY, 2CN and ABC-FM of the national broadcasting system; two commercial stations, 2CA, and 2CC; and three public stations, 2XX, 1PPP and 2SSS-FM. There are three television stations, ABC Channel 3 of the national broadcasting system; Channel 0-28 of the Special Broadcasting Service and Australian Capital Television Pty Ltd (Capital 7), a Canberra based commercial station.

## Social

See also Chapter 9, Health; Chapter 10, Education; and Chapter 11, Law and Order.

### Schools

The *Education Ordinance 1937* provides for the compulsory attendance at school of children between the ages of six and fifteen years. Government schools are administered by the A.C.T. Schools Authority, which became a statutory body under the *Schools Authority Ordinance 1976* in January 1977. The Authority Council and school boards are representative of teachers, parents and the community. The A.C.T. Schools Accrediting Agency within the Authority system accredits courses and administers student assessment procedures for Years 11 and 12.

In July 1987 there were seventeen government high schools in the Australian Capital Territory and eight secondary colleges. High schools cater for Years 7 to 10 and secondary colleges for Years 11 and 12. In addition, there is a Year 9 to 12 school and a kindergarten to Year 10 school. Secondary students enrolled totalled 17,930.

Sixty-seven government schools provide courses at primary level, two of these being in rural districts and one at Jervis Bay. There is also an early childhood education school. The number of students enrolled in government primary schools at July 1987 was 22,149.

Educational guidance services are provided by the Educational Guidance Centre and by school counsellors allocated to each school.

There are four government special schools in the Australian Capital Territory with a total enrolment of 372 students in July 1987. These schools cater for pre-school, primary and secondary school aged students who are physically or mentally handicapped. An annex for physically disabled students operates on a mainstream primary campus.

Mildly intellectually handicapped children are served by learning centres attached to ten primary schools and seven high schools. Special units for deaf children are available at three schools. Blind children also receive specialised support. Children below school age with learning, sight or hearing problems receive assistance from specially-trained staff at pre-schools, at the Therapy Centre and in their homes. Eleven primary schools cater for children of junior primary age who are unable to adjust to a normal class situation. Two schools cater for children with language and communication disorders.

Special English classes for children of non-English speaking background are available at fifty-nine primary schools, eighteen high schools and eight secondary colleges. Three Introductory English Centres (two for primary, one for secondary aged students) cater for migrant or refugee children with little or no English. They attend for up to six months and then return to their neighbourhood school.

The seventy-five pre-schools provide facilities for 4,397 children between the ages of three and four years.

In July 1986 there were twenty-two non-government primary schools in Canberra, eight schools offering both primary and secondary schooling and five schools with secondary grades only. There were 10,266 pupils enrolled in primary grades at non-government schools and 9,762 in the secondary grades.

### Higher education institutions

The Australian National University was established by an Act of Parliament and is administered by a governing council. The Institute of Advanced Studies within the University is a centre of research and training in research. It includes the John Curtin School of Medical Research, and Research Schools of Physical Sciences, Social Sciences, Pacific Studies, Chemistry, Biological Sciences and Earth Sciences. The Mount Stromlo and Siding Spring Observatories are part of the Institute of Advanced Studies. The Faculties carry out both undergraduate and postgraduate training and research, and are composed of the Faculties of Arts, Asian Studies, Economics and Commerce, Law and Science. The total student enrolment in 1986 was 6,349. The University has established a number of academic research centres.

The Canberra College of Advanced Education is administered by a governing council, constituted under an Act of Parliament and offers courses in six schools—Applied Science, Communication, Education, Environmental Design, Information Sciences and Engineering, and Management. Courses have a professional or vocational orientation and lead to Bachelor and Master degrees, and to Associate Diploma, Diploma and Graduate Diploma awards. There were 5,964 students enrolled in 1986. The College has set up several research centres.

### Continuing education

The Centre for Continuing Education is part of the Australian National University and it aims to foster 'the learning society' by enriching the contacts between the University and the community to their mutual advantage. The Centre offers a wide range of courses in the natural and social sciences and the humanities.

## Tourism

Tourism is of paramount importance to the Territory's economy and in the planning and development of the Capital. The A.C.T. has only 1.6 per cent of the national population, yet receives 2.1 per cent of annual interstate visits and 12 per cent of Australia's international visitors; altogether approximately 1.4 million persons aged 14 years and over stay one or more nights. Tourism injects an estimated \$250 million into the economy and sustains employment for 7,000 people.

The official tourist servicing and marketing operation in the A.C.T. is provided by the Canberra Tourism Development Bureau. Planning and development of physical facilities remain the responsibility of the National Capital Development Commission. The Bureau operates a highway reception and information centre on the northern (main) gateway to the city, and branch offices in Sydney, Melbourne and Perth. The total operational cost, including salaries and overtime, was approximate \$2.7 million in 1986-87.

Tourist features most patronised in the A.C.T. are the Australian War Memorial, Australian National Gallery, Black Mountain Telecommunications Tower, High Court of Australia, Parliament House, the old Parliament House, National Botanic Gardens, National Library, Royal Australian Mint and Regatta Point Planning Exhibition. Mountain lookouts, lakes and reserves are also significant attractions.

## Finance

In the following table, identifiable revenue and outlay relating to the Australian Capital Territory have been classified in a National Accounts form. The table covers transactions of the Commonwealth Government in respect of the Australian Capital Territory in the Consolidated Revenue Fund and the following trust funds: Australian Capital Territory Forestry, Australian Capital Territory Housing, Australian Capital Territory Transport and Australian Capital Territory Suspense. In addition, details of the financial transactions of the following public corporations are also covered: Australian Capital Territory Electricity Authority, Commonwealth Brickworks (to September 1979), Canberra Retail Market Trust, National Capital Development Commission, the Canberra Theatre Trust, the Canberra College of Advanced Education, A.C.T. Gaming and Liquor Authority, Canberra Commercial Development Authority and the Australian Capital Territory Health Commission including the Canberra and Woden Valley Hospitals. Not included are: revenue derived by the

Commonwealth Government from income taxes, sales tax, etc., levied in the Australian Capital Territory; outlay on items of a national character such as defence, civil aviation, railways, etc.; and payments to residents from the National Welfare Fund.

| Net charge to Commonwealth budget (b) . . . . .                     | 338.6   | 372.0   | 449.7                |

(a) Excludes estimate of expenditure on Police Services in the Australian Capital Territory. Information on the actual expenditure on these services is not available. (b) This item is a partial measure of the net difference between revenues raised and expenditures made in the Australian Capital Territory because expenditures have been overstated by inclusion of outlays on Commonwealth offices and national works, and revenues understated by exclusion of income taxes, sales tax, etc. and excise duties levied in the Australian Capital Territory. This information is not separately available.

## NORFOLK ISLAND

### General description

Norfolk Island, discovered by Captain Cook in 1774, is situated approximately in latitude 29°02'S, longitude 167°57'E. Its total area is approximately 3,455 hectares, the island being about 8 kilometres long and 5 kilometres wide. It is 1,676 kilometres from Sydney, 1,063 kilometres from Auckland and 772 kilometres from Noumea. The coastline, which is 32 kilometres long, consists of almost inaccessible cliffs rising from the waters edge, except at Kingston in the south and the landing place at Cascade on the northern side. The climate is

equable, the average daily maximum temperature varying between 16°C and 28°C, and the average annual rainfall is 1,350 millimetres. The resident population is about 1,800.

The island served as a penal station from 1788 to 1814 and from 1825 to 1855. In 1856, 194 descendants of the *Bounty* mutineers were transferred from Pitcairn Island.

### **Administration**

In 1856, the island was created a distinct and separate settlement under the jurisdiction of the Governor of New South Wales. In 1897 it was made a dependency under the Governor of that colony, and finally, by the passage of the *Norfolk Island Act 1913*, became a Territory of Australia.

In May 1978, the Government announced that it should try to develop for Norfolk Island a form of government involving the island's own elected representatives under which the necessary revenue could be raised by its own system of law. The *Norfolk Island Act 1979*, which was assented to on 30 May, established the framework for this objective. In broad terms, the Act equips Norfolk Island with responsible legislative and executive government to enable it to run its own affairs to the greatest practicable extent. Wide powers are exercised by the *Norfolk Island Legislative Assembly* and by an *Executive Council*, comprising the executive members of the *Legislative Assembly* who have ministerial-type responsibilities. The Act preserves the Commonwealth's responsibility for Norfolk Island as a Territory under its authority, with the Minister for the Arts, Sport, the Environment, Tourism and Territories as the responsible Minister; and indicates the Parliament's intention that consideration will be given to an extension of the powers of the *Legislative Assembly* and the political and administrative institutions of Norfolk Island within five years. In 1985 legislative and executive responsibility for a range of matters was formally transferred to the Norfolk Island Government. Consideration is being given to the transfer of further powers as part of an ongoing process of devolution of responsibility to the local community.

The Office of the Administrator is financed from Commonwealth expenditure which amounted to \$362,000 in 1986-87. A further \$408,000 was provided by the Commonwealth during the year for the restoration and maintenance of historic structures.

### **Economic activity**

The island's major economic activity is tourism. Primary production is not fully adequate for local needs and foodstuffs are imported from New Zealand and Australia.

#### **Primary industries**

The soil on the island is particularly fertile, the climate equable and the rainfall fairly evenly distributed except for a pronounced dry period in November. This enables a wide range of temperate and semi-tropical products to be cultivated. However, the island's comparative isolation presents trading difficulties, and there is only very limited production of export crops.

Fish are in abundance and in the past a number of ventures have been formed to exploit this resource, but they have been short-lived, mainly because of the lack of a sheltered harbour. A modern whaling station was started on the island in 1955, and production commenced during the second half of 1956. Owing to a marked scarcity of whales after 1961 the station was closed down.

A forestry program is being carried out to increase the resources of Norfolk Island Pine and to introduce suitable types of eucalypts.

#### **Tourists**

Regular air services to the island are available for those who seek a quiet holiday in surroundings of beauty and historic interest. At present, accommodation consists of flats and hotels as well as licensed and unlicensed guest houses. There were 29,085 tourist arrivals in 1986-87.

## Employment

A large proportion of the population derives its income from various aspects of the tourist industry including the operation of hotels and low duty stores. A number of clerical and other positions are available to islanders in the Norfolk Island Administration. Very few people rely entirely on agricultural pursuits for their income.

## Finance

Until 1979, Norfolk Island revenue was supplemented by annual grants from the Commonwealth Government. Under present constitutional arrangements, the cost of maintaining the island, other than the Administrator and his staff, is met as far as practicable from island sources.

### NORFOLK ISLAND: REVENUE AND EXPENDITURE

## Trade, transport and communication

Imports to Norfolk Island since World War II have risen in value from \$65,000 in 1945-46 to over \$23 million in 1985-86. The major proportion came from Australia and New Zealand. Exports in 1985-86 amounted to \$2.6 million, with Australia and New Zealand as the principal markets.

Two shipping companies operate cargo services to Norfolk Island at approximately 6 weekly intervals, linking the island with Australia, New Zealand and other islands in the South Pacific area.

A passenger and air freight service between Sydney and Norfolk Island is operated by East-West Airlines Ltd. Air New Zealand Limited provides a service 2-3 times a week to the island from Auckland. Flights between Norfolk Island and Brisbane are operated by Air New South Wales 2-3 times a week and by Norfolk Island Airlines 2-4 times a week.

There are approximately 80 kilometres of motor roads on the island. A substantial section of the population possesses private motor cars. Hire cars, taxis and scooters are available.

The island has an automatic telephone exchange and international telephone connection with Australia, New Zealand and Fiji by way of the ANZCAN submarine cable system. A local broadcasting service is operated by the Administration.

## Education

Education is free and compulsory between the ages of 6 and 15 years. The school, which is conducted for the Administration by the New South Wales Department of Education, conforms to the Australian standard of public education, ranging from Kindergarten to the School Certificate (Year 10) level. The number of students enrolled at 30 June 1986 was 315.

Some bursaries, subject to a means test, are available for pupils who wish to attend a mainland school either to continue their studies beyond the School Certificate level or to undertake high school courses not available on the island. A limited number of trainee scholarships are available for pupils who have left school and wish to undertake apprenticeships or similar training away from the island.

### Judiciary

The judicial system of Norfolk Island consists of a Supreme Court and a Court of Petty Sessions. The Supreme Court is the highest judicial authority in the Territory and is a superior court of record with original criminal and civil jurisdiction. The jurisdiction of the court is exercised by one judge sitting in court or, to the extent provided by or under ordinance, sitting in chambers. The jurisdiction of the Court of Petty Sessions is exercised by the Chief Magistrate or any three Magistrates.

### HEARD ISLAND AND McDONALD ISLANDS

These islands, about 4,100 kilometres south-west of Fremantle, were transferred from the United Kingdom to Australia as from 26 December 1947. The laws of the Australian Capital Territory were declared to be in force in the Territory of Heard Island and McDonald Islands by the *Heard and McDonald Islands Act 1953*.

In December 1947, an Australian scientific station was established on Heard Island. Meteorological investigations were conducted until the station was closed in March 1955 following the establishment of Mawson Station on the Antarctic mainland. Australian expeditions have since visited the island from time to time. Heard Island is about 43 kilometres long and 20 kilometres wide. The McDonald Islands are 43 kilometres to the west of Heard Island. They are small, rocky and precipitous. The first known landing on McDonald Island, the largest of the group of the same name, took place on 27 January 1971 when two members of the Australian National Antarctic Research Expeditions (ANARE) paid a short visit on their way to the Heard Island station.

### AUSTRALIAN ANTARCTIC TERRITORY

An Imperial Order in Council of 7 February 1933 placed under Australian authority all the islands and territories, other than Terre Adelie, situated south of 60°S latitude and lying between 160°E longitude and 45°E longitude. The Order came into force with a proclamation issued by the Governor-General on 24 August 1936 after the passage of the *Australian Antarctic Territory Acceptance Act 1933*. The boundaries of Terre Adelie were definitively fixed by a French Decree of 1 April 1938 as the islands and territories south of 60°S latitude lying between 136°E longitude and 142°E longitude. The *Australian Antarctic Territory Act 1954* declared that the laws in force in the Australian Capital Territory are, so far as they are applicable and are not inconsistent with any ordinance made under the Act, in force in the Australian Antarctic Territory.

On 13 February 1954 the Australian National Antarctic Research Expeditions (ANARE) established a station on Mac-Robertson Land at latitude 67°36'S and longitude 62°53'E. The station was named Mawson in honour of the late Sir Douglas Mawson and was the first permanent Australian station to be set up on the Antarctic continent. Scientific research (including meteorology, cosmic ray physics and glaciology) is conducted at Mawson, which is also a centre for coastal and inland survey expeditions.

A second Australian scientific research station was established on the coast of Princess Elizabeth Land on 13 January 1957, at latitude 68°35'S and longitude 77°58'E. The station was named in honour of the late Captain John King Davis, second-in-command of two of Mawson's expeditions and master of several famous Antarctic ships. The station was temporarily closed on 25 January 1965 and re-opened on 15 February 1969. On 4 February 1959 the Commonwealth Government accepted from the United States Government custody of Wilkes station, established by the United States on 16 January 1957, on Vincennes Bay at latitude 66°15'S and longitude 110°32'E. The station was named in honour of Lieutenant Charles Wilkes who commanded the 1938-42 United States expedition to the area. The station was closed on 19 February 1969 when activities were transferred to Casey station

built about 2 kilometres south of Wilkes. Casey station, which was opened on 19 February 1969, was named in honour of Lord Casey, former Governor-General of Australia, in recognition of his long association with Australia's Antarctic effort.

In 1981-82, a ten-year program for redeveloping Australia's Antarctic stations began and is now well advanced. The stations act as bases for mounting inland programs and provide basic facilities for weather observations, communications and research.

The highest priority for research relates to the study of living and mineral resources of the Antarctic continent and off-shore areas and the environmental effects of their exploration and exploitation.

## COCOS (KEELING) ISLANDS

### General description

The Territory of the Cocos (Keeling) Islands comprises a group of 27 small coral islands in two separate atolls in the Indian Ocean, 2,768 kilometres north-west of Perth.

The Territory's administrative community, airport and animal quarantine station are located on West Island, the largest island, about 10 kilometres long. The Cocos Malay community lives on Home Island. The main atoll is low-lying, flat, and thickly covered by coconut palms, and surrounds a lagoon which has an anchorage in the northern part but which is extremely difficult for navigation.

The climate is equable and pleasant, usually being under the influence of the south-east trade winds for about nine months of the year. However, the winds vary at times, and meteorological reports from the Territory are particularly valuable for those engaged in forecasting for the eastern Indian Ocean. The temperature varies between 21°C and 32°C, and the average yearly rainfall is 1,998 millimetres. There are occasional violent storms.

### History and administration

The islands were discovered in 1609 by Captain William Keeling of the East India Company, but were uninhabited until Alexander Hare and John Clunies-Ross established small settlements at different points on the main atoll in 1826 and 1827 respectively. Clunies-Ross secured sole possession in 1831, and the islands were declared part of the British Dominions in 1857. In 1878 responsibility for the supervision of the islands was transferred to the Government of Ceylon and eight years later, to the Government of the Straits Settlements.

In 1903 the islands were incorporated in the Settlement of Singapore but were attached again to Ceylon during World War II while Singapore was under Japanese occupation.

By mutual agreement between the British and Australian Governments, and confirmed by complementary legislation, the islands became an Australian territory in 1955. The Australian Government purchased the Clunies-Ross interests in the Territory in 1978, except for the family home and grounds.

The *Cocos (Keeling) Islands Act 1955* is the basis of the Territory's administrative, legislative and judicial systems.

An Administrator, appointed by the Governor-General and responsible to the Minister for the Arts, Sport, the Environment, Tourism and Territories, is the senior Government representative in the Territory.

On 25 July 1979 the Cocos (Keeling) Islands Council, elected by members of the Home Island community, was established. The Council has responsibility for a range of functions in the Home Island village area, advises the Administrator on local affairs, and is also empowered to make representations on ordinances proposed for the Territory.

The Cocos Islands Co-operative Society Limited, also established in 1979, conducts the business enterprises of the Cocos people. The Co-operative undertakes copra production, building maintenance and construction, stevedoring and lighterage services, retailing and provision of accommodation and catering services.

The Territory's own postal service, including a philatelic bureau, was opened in 1979. The service, run by the Administration, provides local employment and its profits are directed to the Cocos (Keeling) Islands Council for use on community projects.

On 6 April 1984 the Cocos Malay community, in an Act of Self Determination which took the form of a referendum observed by the United Nations, chose to integrate with Australia.

The population of the Cocos (Keeling) Islands at 30 June 1986 was 616, distributed between Home Island (414) and West Island (202).

## **Transport and communication**

There is an airport of international standard at West Island, controlled by the Administrator under licence from the Department of Transport and Communications. The Department of the Arts, Sport, the Environment, Tourism and Territories operates a weekly air charter service which alternates between the routes Perth–Christmas Island–Cocos (Keeling) Islands–Perth and Perth–Cocos (Keeling) Islands–Christmas Island–Perth. A shipping service operates to the Territory every 6-8 weeks. The Administration operates and maintains, on behalf of the Overseas Telecommunications Commission (Australia), a satellite communications facility which provides telephone, facsimile and telex services to the Australian mainland and beyond. There are local postal and telephone services, and a non-commercial broadcasting station.

## **CHRISTMAS ISLAND**

### **General description**

Christmas Island is an isolated peak situated in the Indian Ocean, latitude 10°25' S, longitude 105°40' E. It is approximately 360 kilometres south from Java Head at the southern entrance to Sunda Strait, 1,300 kilometres from Singapore and 2,600 kilometres from Perth. Christmas Island covers an area of about 135 square kilometres. It consists of a central plateau varying in height from 250 metres above sea level at the eastern side of the island to 150 metres on the western side. Several prominent rises in the plateau reach 360 metres above sea level. The plateau descends to the sea in a series of steep slopes alternating with terraces. Sea cliffs over 20 metres high run along a considerable portion of the coastline except in a few places, the chief of which is Flying Fish Cove where the principal settlement is located and which is the only anchorage.

The climate is tropical, with prevailing winds coming from the south-east to east-south-east from May to December, and occasionally shifting round to between north and west from December to April (the wet season). The average yearly rainfall is 2,673 mm with a marked summer incidence. The porous nature of the ground prevents the formation of pools of water, but there are several good springs which provide an adequate supply of fresh water for the population and for the mining operation. The mean average temperature is about 27°C, and does not vary greatly throughout the year.

### **Economy**

The economy of the Territory is based almost entirely on the mining and extraction of phosphate. During the year ended 30 June 1987, 448,700 tonnes of phosphate rock were sent to Australia and New Zealand, while 300,293 tonnes were exported elsewhere. Mining operations on Christmas Island are conducted by the Phosphate Mining Corporation of Christmas Island, (PMCI), a Commonwealth statutory authority. All rainforest clearing for mining must be approved by the Government Conservator, an officer of the Australian National Parks and Wildlife Service. A program of land rehabilitation has been adopted and a nursery is maintained for reforestation.

The Government has actively encouraged private sector investment in new activities on the island to secure an economic future which is not dependent on mining. Several worthwhile development proposals which have been received are progressing, including a major tourist hotel/casino project.

## Population

Some 2,000 people were residents of the island at 30 June 1987. The majority are of Chinese extraction, and the remainder includes mainly Malays and Caucasians. There is no indigenous population. Under the provisions of the *Christmas Island Act 1958* and the *Australian Citizenship Act 1948* almost all residents are Australian citizens or have permanent Australian resident status.

## Education

The Christmas Island Area School is run by the Administration and is staffed by teachers provided by the Commonwealth Teaching Service, which staffs government schools in the Australian Capital Territory. The school provides education from pre-school level through to Year 10 secondary level. It follows a locally developed curriculum aligned with that used in Western Australia. There are 437 students enrolled at the school. A further 35 senior secondary students (Years 11 and 12) in Western Australian schools receive assistance from the Administration.

The first full-time English courses for PMCI employees commenced on 23 April 1986. Full and part-time English courses have also been conducted for former PMCI workers and other island residents.

## History and administration

Summarised particulars of the history of Christmas Island up to its administration by the United Kingdom as a separate Crown Colony (from 1 January 1958, pending transfer to Australia) are given in *Year Book* No. 51, and in earlier issues. On 1 October 1958, the island was accepted by Australia under the *Christmas Island Act 1958*. The Territory is administered by an Administrator appointed by the Governor-General. Responsibility for the administration and government of the Territory rests with the Minister for the Arts, Sport, the Environment, Tourism and Territories. The Administrator reports to the Minister and is subject to his direction. The laws which were in force on the island at 30 September 1958 were continued as the laws of the Territory after its transfer to Australia.

The *Migration Act 1958* was extended to the Territory from 23 January 1981, enabling all island residents to become Australian residents and to acquire Australian citizenship. A number of measures have since been taken to extend the same benefits and responsibilities to island residents as apply on the Australian mainland so that the islanders will be in no better or worse a position than their mainland counterparts.

The *Christmas Island Administration (Miscellaneous Amendments) Act 1984* received Royal Assent on 18 October 1984. The Act provides for the extension of the *Commonwealth Electoral Act 1918*, *Social Security Act 1947*, *National Health Act 1953*, *Student Assistance Act 1973* and related Acts relevant to Christmas Island. Following passage of the legislation, normal social security and health benefits applied with effect from 1 October 1984 and 18 October 1984 respectively and Australian citizens in the Territory were entitled to vote in federal elections and referendums from 18 October 1984. The *Lands Ordinance 1987* provides for the leasing of land for commercial and residential purposes.

The *Services Corporation Ordinance 1984* was made on 26 October 1984, creating the Christmas Island Services Corporation (CISC) with power to provide many local and community services on the island.

The *Taxation Laws Amendment Act 1985* received Royal Assent on 30 May 1985. The Act provided for the introduction of full company tax and the Medicare levy, as well as the phased introduction of personal income tax on Christmas Island over a four year period from 1 July 1985.

The *Christmas Island Assembly Ordinance 1985* and the Christmas Island Assembly (Election) Regulations permitted Christmas Island residents to elect their first Assembly on 28 September 1985. The inaugural meeting was held on 6 October 1985. Nine members were elected for a one-year term under a voting system similar to that used in electing Senators of the Commonwealth of Australia. The Christmas Island Assembly has responsibility for directing the Christmas Island Services Corporation in the performance of its functions.

## Transport and communication

Sea transport to and from the island is maintained by vessels operating under contractual arrangements between PMCI, the Australian Phosphate Corporation and the Australian National Line.

An air charter arranged by the Department of the Arts, Sport, the Environment, Tourism and Territories, provides a weekly service to the island following alternate routes Perth-Christmas Island-Cocos (Keeling) Islands-Perth one week and Perth-Cocos (Keeling) Islands-Christmas Island-Perth the next. The Department also operates a weekly air charter between Singapore and the island.

The Territory has its own radio broadcasting station, police force, hospital, postal service and philatelic bureau. The VISTA communications system which provides an external telex and telephone service by INTELSAT satellite, and a back-up INMARSAT system, became fully operational on 17 October 1985.

## CORAL SEA ISLANDS TERRITORY

The Coral Sea Islands are situated east of Queensland between the Great Barrier Reef and longitude 156°06'E and between latitudes 12° and 24°S. The Territory comprises a sea area of approximately 780,000 square kilometres. The islands (or cays) are largely formed of sand and coral. Some have grass or scrub cover, but most are extremely small, with no permanent fresh water. A meteorological station, staffed by three people, has operated on Willis Island since 1921. The remaining islands are uninhabited.

In the 19th century many ships were wrecked in the area, and the reefs and islands are often named for the ships which foundered there. There are beacons on the Frederick and Saumarez Reefs and a lighthouse on Bougainville Reef. There are occasional tropical cyclones in the area. Meteorological data are relayed to the mainland from automatic weather stations located on Cato Island, Flinders Reef, Frederick Reef, Holmes Reef, Lihou Reef and Marion Reef.

Six species of sea turtle nest in the Coral Sea Islands Territory, including the largest species in the world, *Dermochelys coriacea*, which is regarded as one of the most endangered of the world's sea turtles. There are at least 24 bird species in the Territory; 13 of these are protected under an Australian-Japanese agreement on endangered and migratory birds. In 1982 the Lihou Reef and Coringa-Herald National Nature Reserves were declared to protect the wildlife in the Territory.

There have been a number of scientific expeditions to the region since 1859, and many specimens of flora and fauna are now housed in Australian herbariums and museums.

In 1969, the Coral Sea Islands became a Territory of the Commonwealth under the Coral Sea Islands Act. The Department of the Arts, Sport, the Environment, Tourism and Territories in Canberra, is responsible for the administration of the Territory. The area is visited regularly by the Royal Australian Navy.

Aerial surveillance of the Territory is undertaken by the Royal Australian Air Force and by chartered civil aircraft. Regular visits are made to the islands by ships of the Royal Australian Navy.

The Jabiru and Challis oil fields are located within the adjacent area of the Territory. The Jabiru field commenced production in 1986, and development of the Challis field is being investigated.

## THE TERRITORY OF ASHMORE AND CARTIER ISLANDS

Ashmore Islands (known as Middle, East and West Islands) and Cartier Island are situated in the Indian Ocean some 850 km and 790 km west of Darwin respectively. The islands lie at the outer edge of the continental shelf. They are small and low and are composed of coral and sand. Vegetation consists mainly of grass. The islands have no permanent inhabitants.

Great Britain took formal possession of the Ashmores in 1878 and Cartier Island was annexed in 1909. By Imperial Order in Council of 23 July 1931, the islands were placed under the authority of the Commonwealth of Australia. The islands were accepted by Australia through the *Ashmore and Cartier Islands Acceptance Act 1933* under the name of

---

the Territory of Ashmore and Cartier Islands. By amendments to the Act in 1938, the Territory was annexed to, and deemed to form part of, the Northern Territory. With the granting of self-government to the Northern Territory on 1 July 1978, the administration of the Territory became a direct responsibility of the Commonwealth Government.

Responsibility for the administration of the Territory rests with the Minister for the Territories. Relevant laws of the Northern Territory as at 1 July 1978 presently apply in the Territory. A 1985 amendment to the Ashmore and Cartier Islands Acceptance Act will, when it comes into force, extend to the Territory laws of the Northern Territory as in force from time to time, so providing the Territory with an up-to-date body of law.

Birdlife is plentiful on the islands of Ashmore Reef. Turtles are plentiful at certain times of the year and *bêche-de-mer* is abundant. In recognition of the environmental significance of the area, the Reef was in 1983 given the status of a national nature reserve under the *National Parks and Wildlife Conservation Act 1975*. Regular visits are made to the Reef by officers of the Australian National Parks and Wildlife Service.

An agreement between Australia and Indonesia allows Indonesian traditional fishermen to continue to fish in waters of the Territory. Since 1985, an Australian presence has been maintained at Ashmore Reef during the March to November fishing season to monitor the activities of visiting Indonesian fishermen.

---

## LIST OF SPECIAL ARTICLES AND MISCELLANEOUS MATTER CONTAINED IN PREVIOUS ISSUES

This list refers to special articles and other significant matter which have appeared in previous issues of the *Year Book*.

The figures below indicate, respectively, the number and page of the *Year Book* to which reference is made. In cases where matter was published in more than one previous issue, the volume and page for the last issue containing such matter are given.

### A

- Aboriginal population, 17, 951
- Aborigines
  - Australian, former numbers and distribution of, 23, 687
  - of Australia, 3, 158
- Administrative government, 12, 924
- Advisory Council of Science and Industry, 11, 1195
- Aeronautical telecommunications, 44, 422
- Agricultural and stock departments (conspectus), 14, 1180
- Agricultural colleges and experimental farms, 11, 392
- Air Defence
  - Development, 18, 610
  - Operations since the 1939-45 War, 58, 92
- Anatomy, Australian Institute of, 32, 919
- Animal and Vegetable Diseases and Pests Acts (conspectus), 14, 1066
- Apprenticeship legislation, 16, 602; 23, 767
- Artesian and sub-artesian basins, known (map), 48, 273
- Australia's New Parliament House, 68, 51
- Australian books
  - 1961, select list of, 48, 1166
  - 1966, select list of, 53, 1231
- Australian Capital Territory (*see* 'Canberra', 'Federal Capital' and 'Seat of Government') (map), 39, 367
- Australian Flag, 67, 23
- Australian Institute of Sport, 68, 684

### B

- Barley for grain: distribution of acreage, 1962-63 (map), 50, 1014
- Basic wage judgement, 1937, 30, 564
- Bicentenary, Australia's 1988, 70, 688
- Black Coal in Australia, 66, 395
- Board of Trade Advisory Committee, Report on Commercial Intelligence, 1, 518
- Building stones
  - Australia, 9, 446
  - Queensland, 12, 89

### C

- Canberra
  - fifty years of development, 49, 122
  - past and present (*see also* 'Federal Capital' and 'Seat of Government'), 24, 454
- Cancer in Australia, 1881 to 1910, 5, 230
- Cattle: distribution, March 1963' (maps), 50, 1050, 1082

## Census and Statistics

Act of 1905 (text), 1, 8

creation of Commonwealth Bureau of, 1, 11

## Census

of Papua and New Guinea, 1966, 53, 141; 55, 1164

The, 53, 163

The 1986—A Portrait of Australia, 70, 122

Censuses, early, 15, 1083

Chemistry, South Australian Department of, 14, 1064

Chinese in Australia, 18, 951

Climate, changes of, 7, 56

Climatology, bulletins of, 34, 11

Clothing and food rationing (1939–45 War), 36, 1084

Coal mining, history of, 3, 515

Coast-line of the Commonwealth of Australia, features, 1, 60

## Coinage

Australian Mints, 52, 675

Decimal and pre-decimal, 52, 671

Pre-federation, 51, 812

Commercial and Industrial Bureau of the Board of Trade, 17, 1037

## Commonwealth

Bank, 11, 815

Savings Bank, 10, 789

Compulsory military training, 12, 1001

Constitution Acts (conspectus), 13, 928

Constitution, of the Commonwealth of Australia, 70, 8

Contingents, Australia–New Zealand and Sudan Campaigns, South Africa, China and 1914–18 Wars, 12, 1019

Control of prices during and since the 1939–45 War, 37, 458

Coolgardie water scheme, 6, 576

Co-operation of producers and of consumers in Australia, 17, 581

Copper-mining, history of, 5, 498

Cost of living inquiry, 1910–11, 5, 1167

Country Roads, Board, Victoria, 15, 526

Crime Victims Survey, 1983, 70, 240

Currency, decimal (*see* Decimal currency)

Currency, international, 13, 1146

Customs Tariff, 1914, 11, 603

## D

Daylight saving, 36, 1119

Decimal coinage, 15, 719; 52, 671

Decimal currency, 51, 809; 52, 671

Decimal Currency Committee, 1959, report, summary of conclusions and recommendations, 49, 835

Defence legislation, Special (1914–18 War), 15, 930

Designs, 12, 1174

Development of telecommunications in Australia, 59, 378

Diphtheria, 16, 1031

Disease, transmission by mosquitoes, 22, 506

Disposals Commission, Commonwealth, 39, 1289

Droughts in Australia, 45, 51; 54, 995

## E

Education, primary—early history, 2, 880

Electricity generation (maps) 39, 1171

Electric power generation and distribution, 39, 1149

*Enemy Contracts Annulment Act 1915* (text), 8, 1095

Enemy patents and trade marks, 13, 1104

Eucalypts, Australian, chemical products of, 10, 92

Eucalyptus timbers, Australian, 10, 85

Exploration of Australia  
 account, 2, 20  
 maps, 8, 35

**F**

Factories and Shops, Acts and Regulations (conspectus), 16, 540

Fauna of Australia, 2, 111

**Federal**

Capital City—map and designs for layout (*see also* 'Canberra' and 'Seat of Government'), 5, 1139  
 Capital Territory—structure and scenery of (*see also* 'Canberra' and 'Seat of Government'), 22, 627

movement in Australia, 1, 17

Ferries in Australia, 25, 199
